

# Perspectum Diagnostics <sup>TM</sup>

*Global experts in diagnostic medicine, medical physics and image analysis*

36% of US population is obese  
24% UK population

In 2008, 170 million of the world's children were obese  
20% EU kids and rising fast

170 million

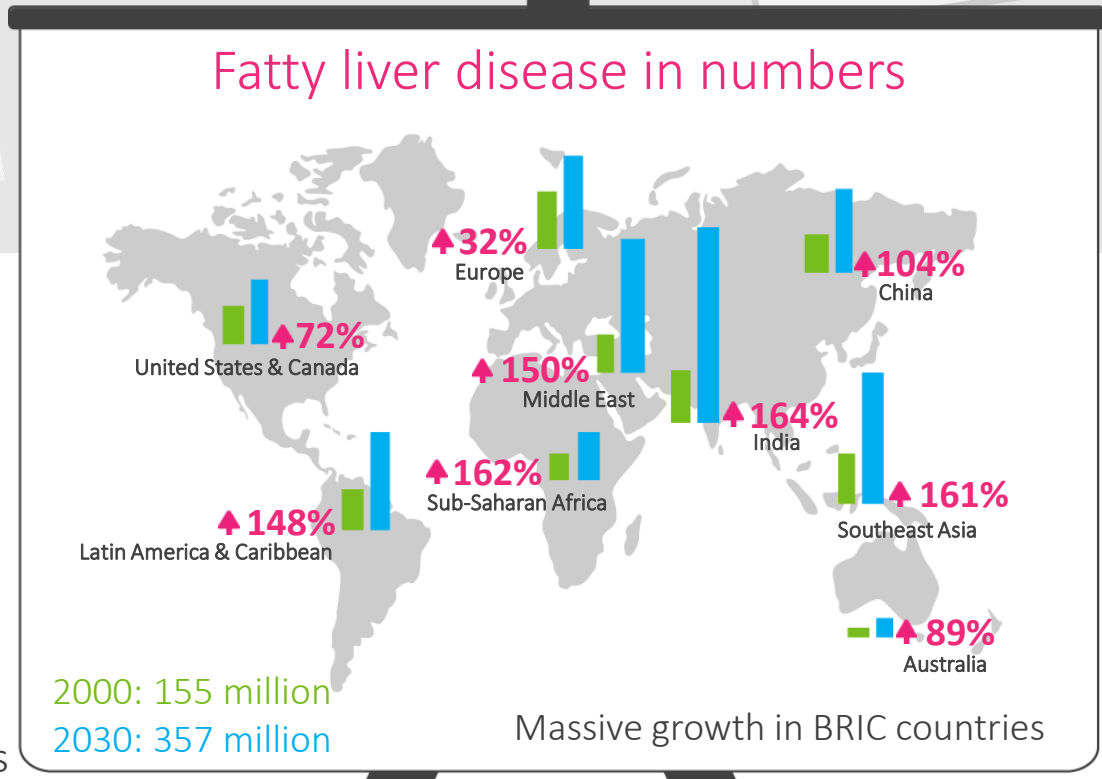

The world's favourite foods

Hepatitis C

-  Cirrhosis = 2% risk of hepatocellular carcinoma *per year*
-  Surge in (non-alcoholic) fatty liver disease and NASH
-  30% Western population has liver disease – ill defined
-  Dame Sally Davies: liver disease is THE main priority<sup>1</sup>
-  Leading cause of liver transplant by 2020
-  Imaging biomarkers may act as surrogate endpoints in drug trials

1. Davies, S.C. "Annual Report of the Chief Medical Officer, Volume One, 2011, On the State of the Public's Health" London: Department of Health (November 2012)

## BUT...

- Currently, testing drug effects is extremely hard
- Recent disappointments with phase 2a studies (Mochida<sup>1</sup>; MRC<sup>2</sup>)
- Pre-clinical & clinical opportunities
- Need to establish link between image-based biomarkers and (epi)genetics
- Need to establish clinical outcomes data from imaging biomarkers with robust, standardised, scalable methods and metrics

- Massive and rapidly growing market for treatment of chronic liver conditions, but need for surrogate markers to measure response to therapy
- No shortage of potential agents - anti-fibrotic, metabolic modulation and immunotherapy options

1. No significant effects of Ethyl-Eicosapentanoic Acid on histologic features of Nonalcoholic Steatohepatitis in a Phase 2 Trial. Sanyal et al, *Gastroenterology* 147; p377-384,, August 2014.

2. <http://www.controlled-trials.com/ISRCTN57849521>

**CE-** marked software for the characterisation of liver tissue using MRI.

## Key Benefits

1. Provides metrics for **iron** and **fat fraction** with a novel, patented method for quantifying **inflammation and fibrosis** (the 'LIF' score).
2. **NO additional hardware required**. Can be deployed in any site offering MRCP.
3. Works on obese patients and those with ascites; **no contrast agents** needed.
4. **Fast** – 10min scan, 4–6 patients per hour, ideal for screening patients to enter trials.
5. High **sensitivity and reproducibility** – suitable for longitudinal monitoring.
6. **Whole liver assessment** – ideal for heterogeneous disease (PSC, NRH, cancer).

# LiverMultiScan

# Multi-parametric MRI stages adult patients with chronic disease (n=79)

JOURNAL OF HEPATOLOGY Volume 60(1): 69-77 (2014)

*'The first non-invasive test to clearly identify even early fibrosis'*

AUROC is 0.94 (95% CI 0.89 – 0.99) to detect **any disease** in a general population (viral hepatitis n=31, FLD n=31, other n=17); sensitivity 86%, specificity 93%

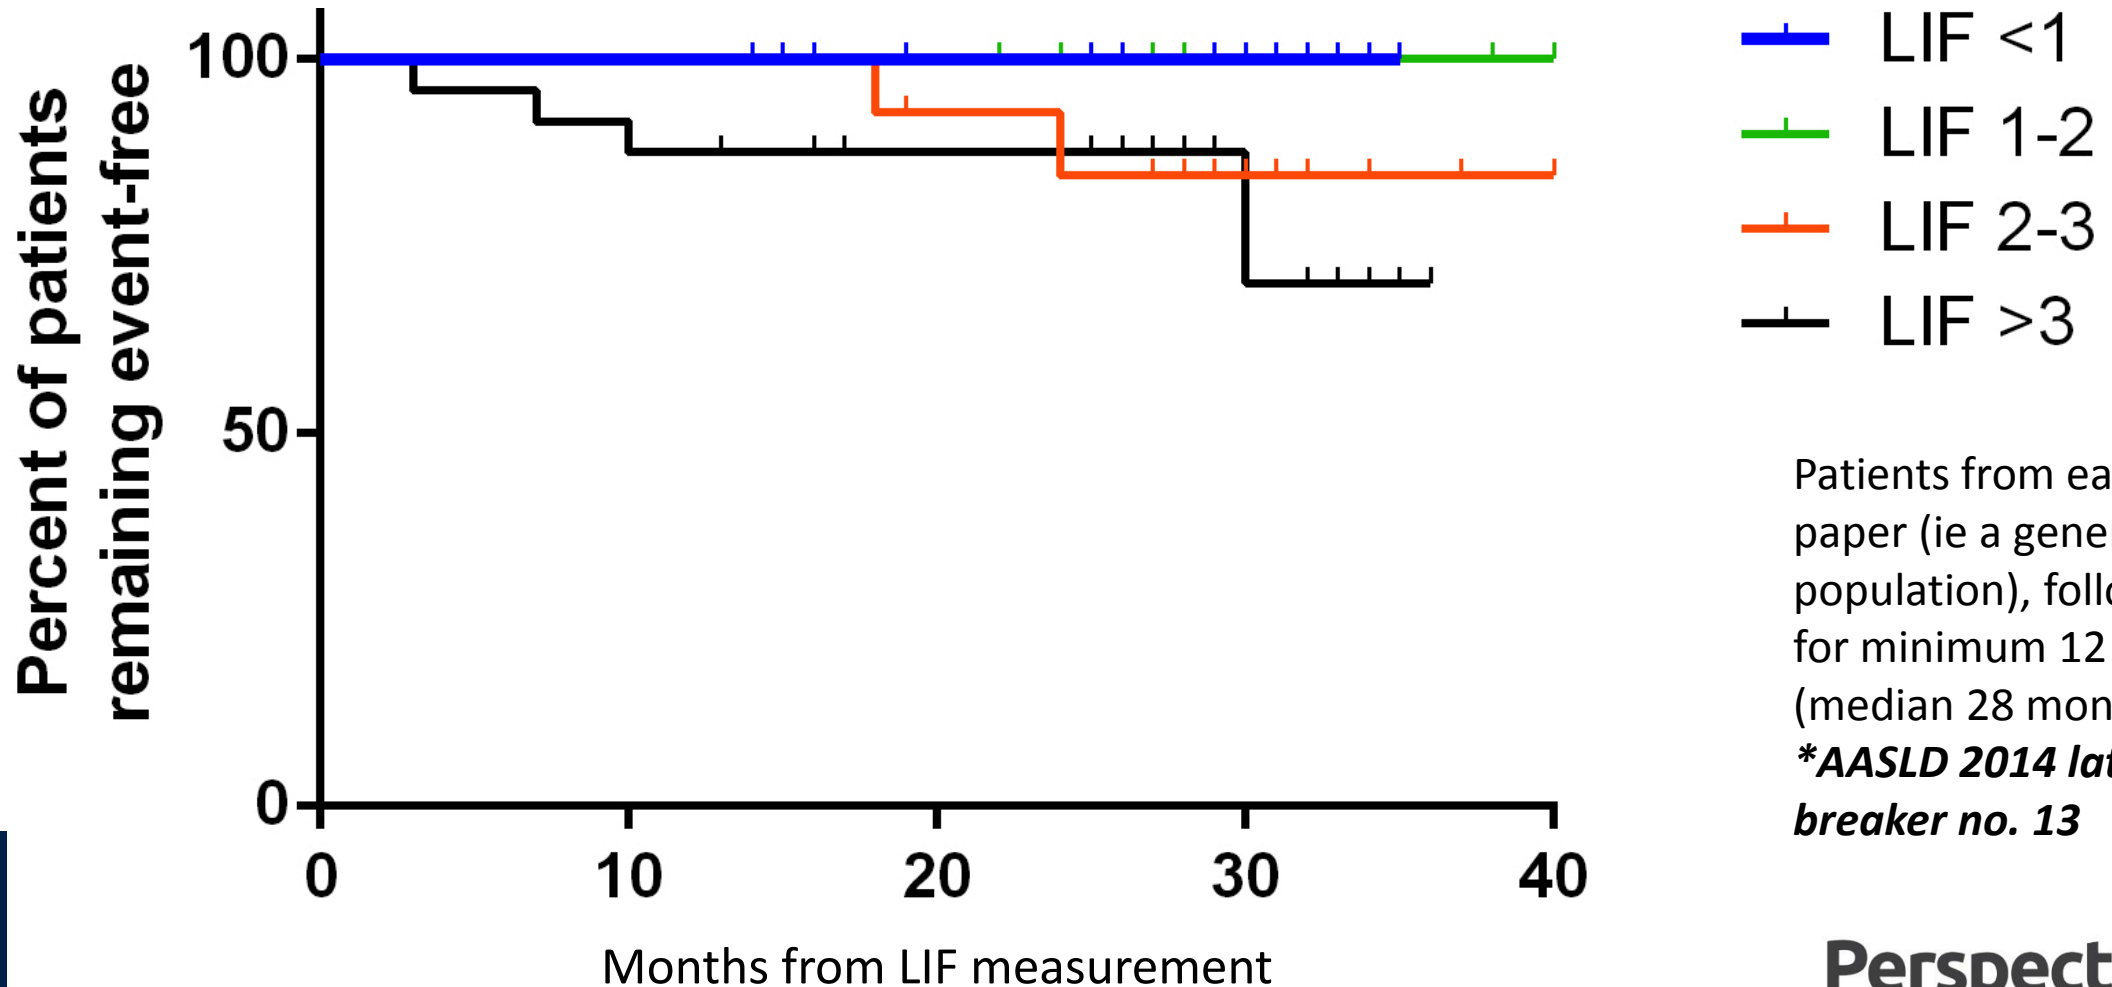

\*The LIF scale represents the range of focus for cT1 values in the liver

# “LIF score accurately predicts clinical outcomes\*”

The first non-invasive imaging test to do so.

Patients from earlier paper (ie a general population), followed up for minimum 12 months (median 28 months)  
 \*AASLD 2014 late-breaker no. 13

## Fatty liver

44 yr old lady, worked fulltime, no overt symptoms.

Pre (left) and post (right) gastric bypass surgery images at L4, (same scale).

Preop BMI 34.3 kg/m<sup>2</sup> & visceral fat 131cm<sup>2</sup>.

Postop BMI 24.4kg/m<sup>2</sup> &  
visceral fat 28.3cm<sup>2</sup>.

Histology showed 90% of hepatocytes had lipid inclusions, and an ISHAK score of 3, with marked pericellular fibrosis as well.

**Diagnosis = NASH**

Bottom row: MRS (left) and LiverMultiScan cT1 image (right) of patient at baseline

**Liver fat (as measured with MR) is clearly reduced**

**Pre op liver fat = 20.4%**

**Pre op cT1 = 996.1ms**

**Clear change in cT1.  
No follow-up biopsy;  
no clinical indication**

**After weight loss liver fat = 1.7%**

**After weight loss cT1 = 783.5ms**

Treated with response to prednisolone and azathioprine over 20 months

Feb 2012

Oct 2012

Oct 2013

Pre treatment  
cT1 = 1008.7  
+/- 12ms

LIF\*  
3.4

After treatment  
cT1 = 919.8 +/-  
46ms

LIF\*  
2.7

After treatment  
cT1 = 826.4 +/-  
24.7ms

LIF\*  
1.4

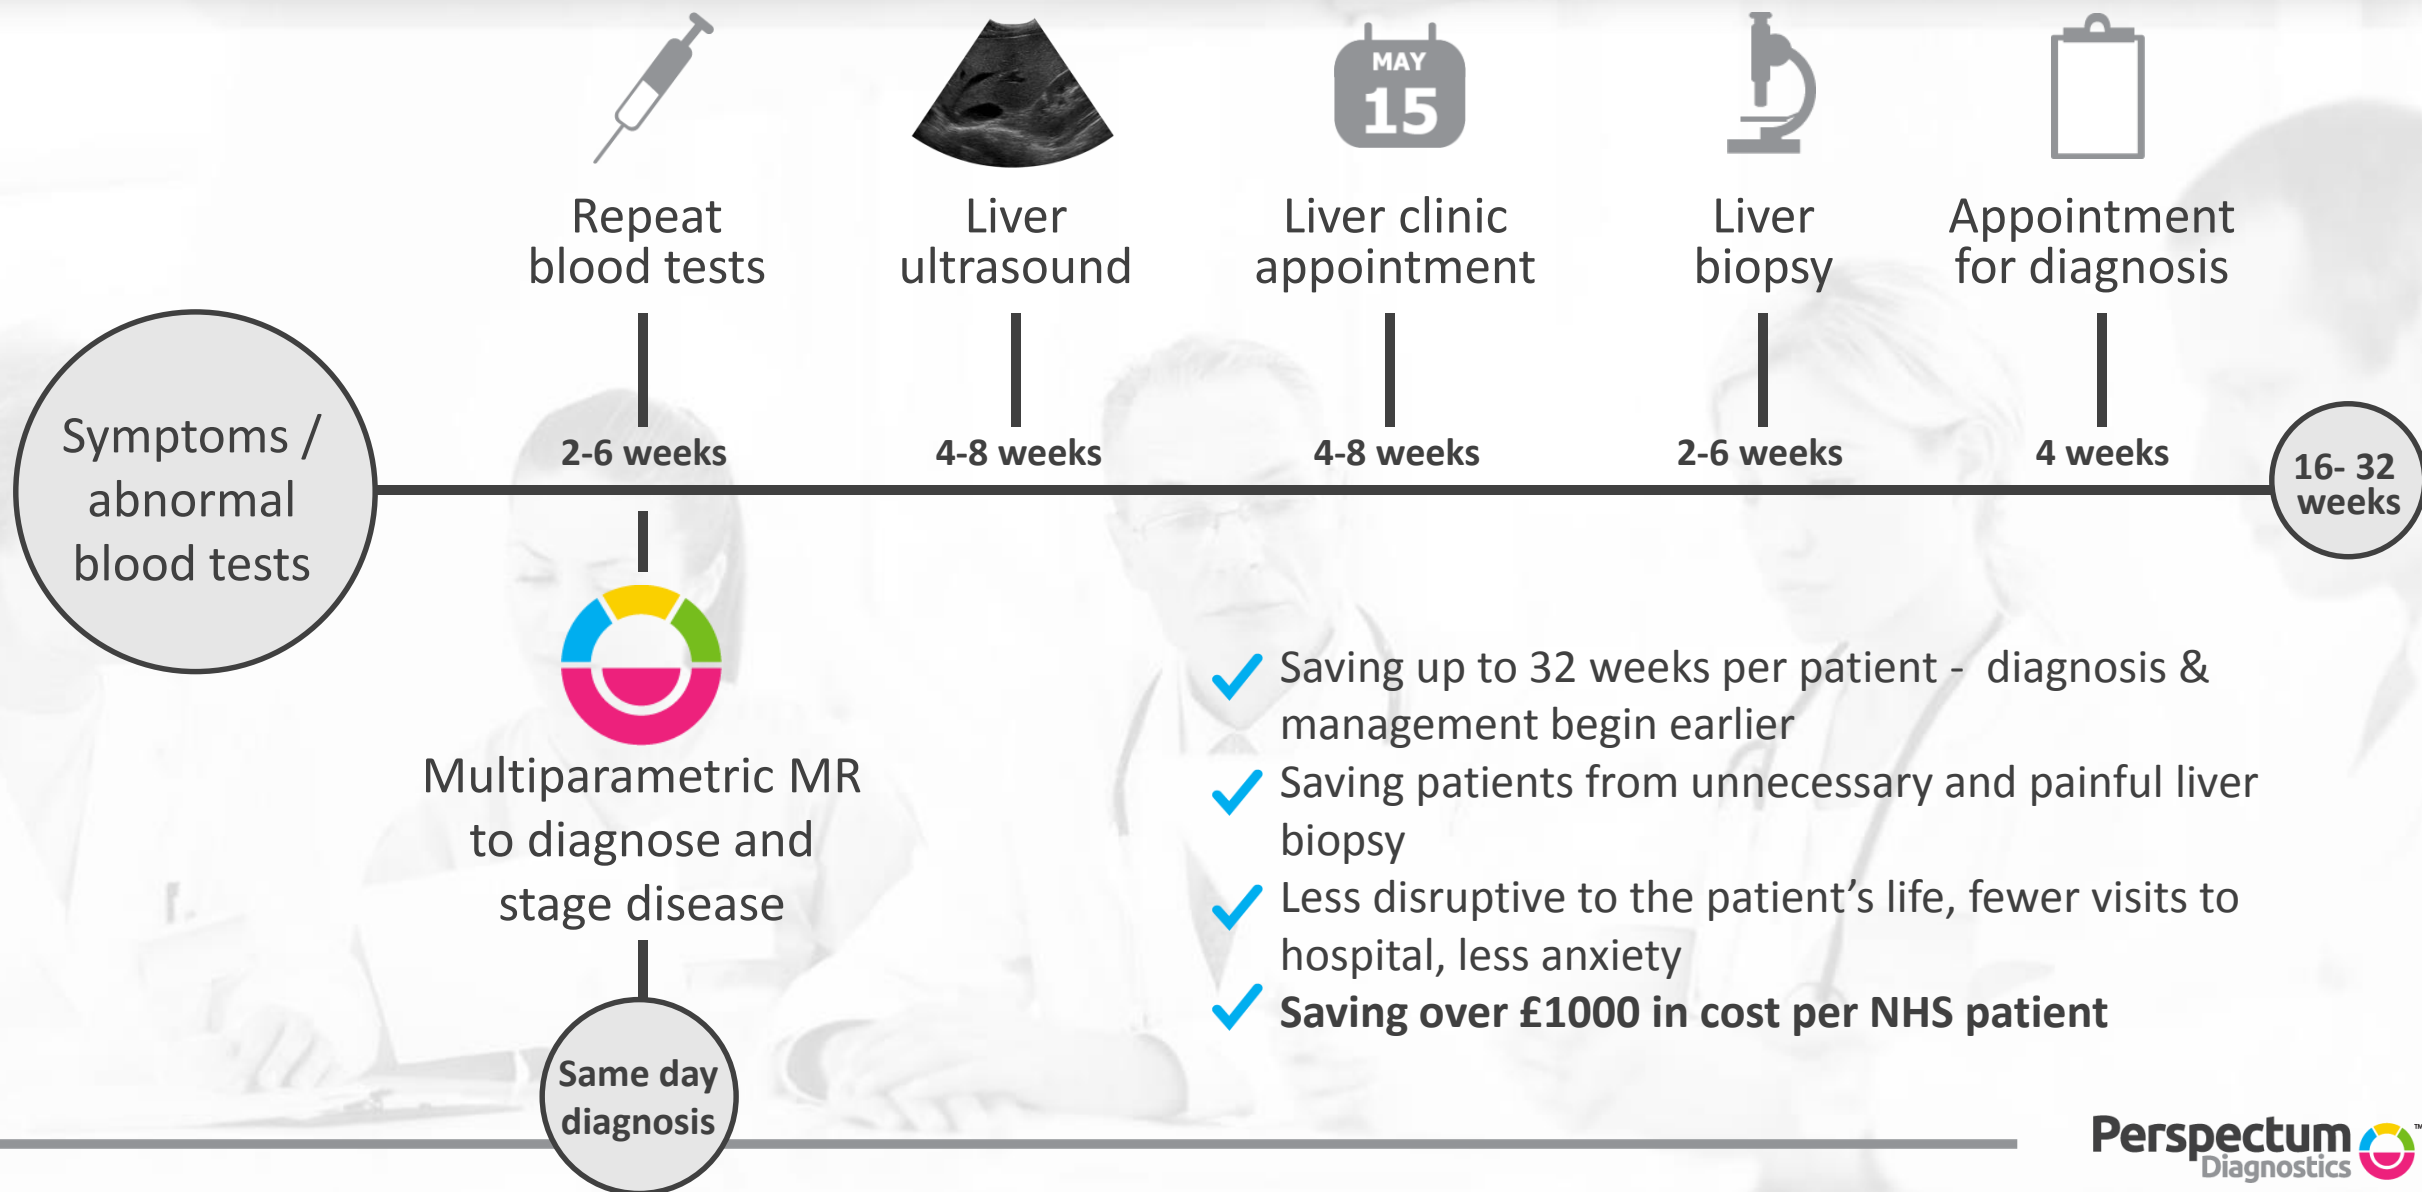

**Normal 12 year old**

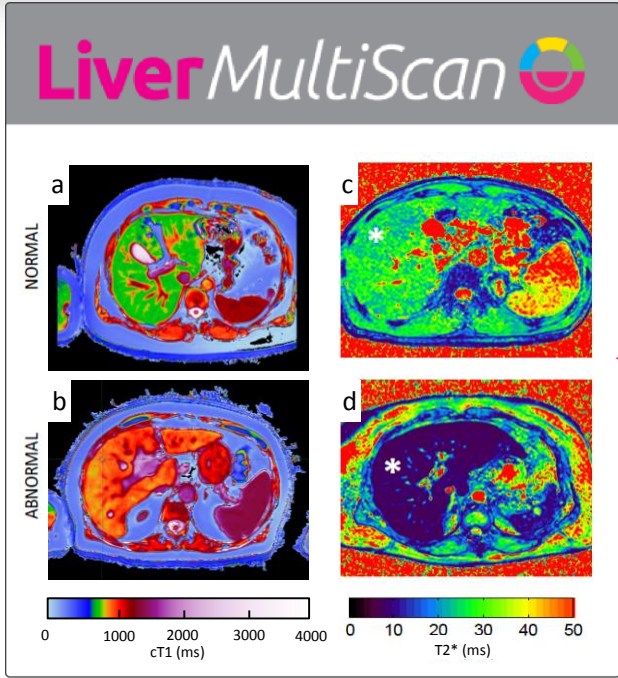

cT1 = 767.3 ms (LIF = 0.8)

**12 year old with NASH + MetS**

cT1 = 990.1 ms (LIF = 3.1)
