# Definitions of AE related to ARVs: What are we talking about?

# The case for ensuring pharmacovigilance

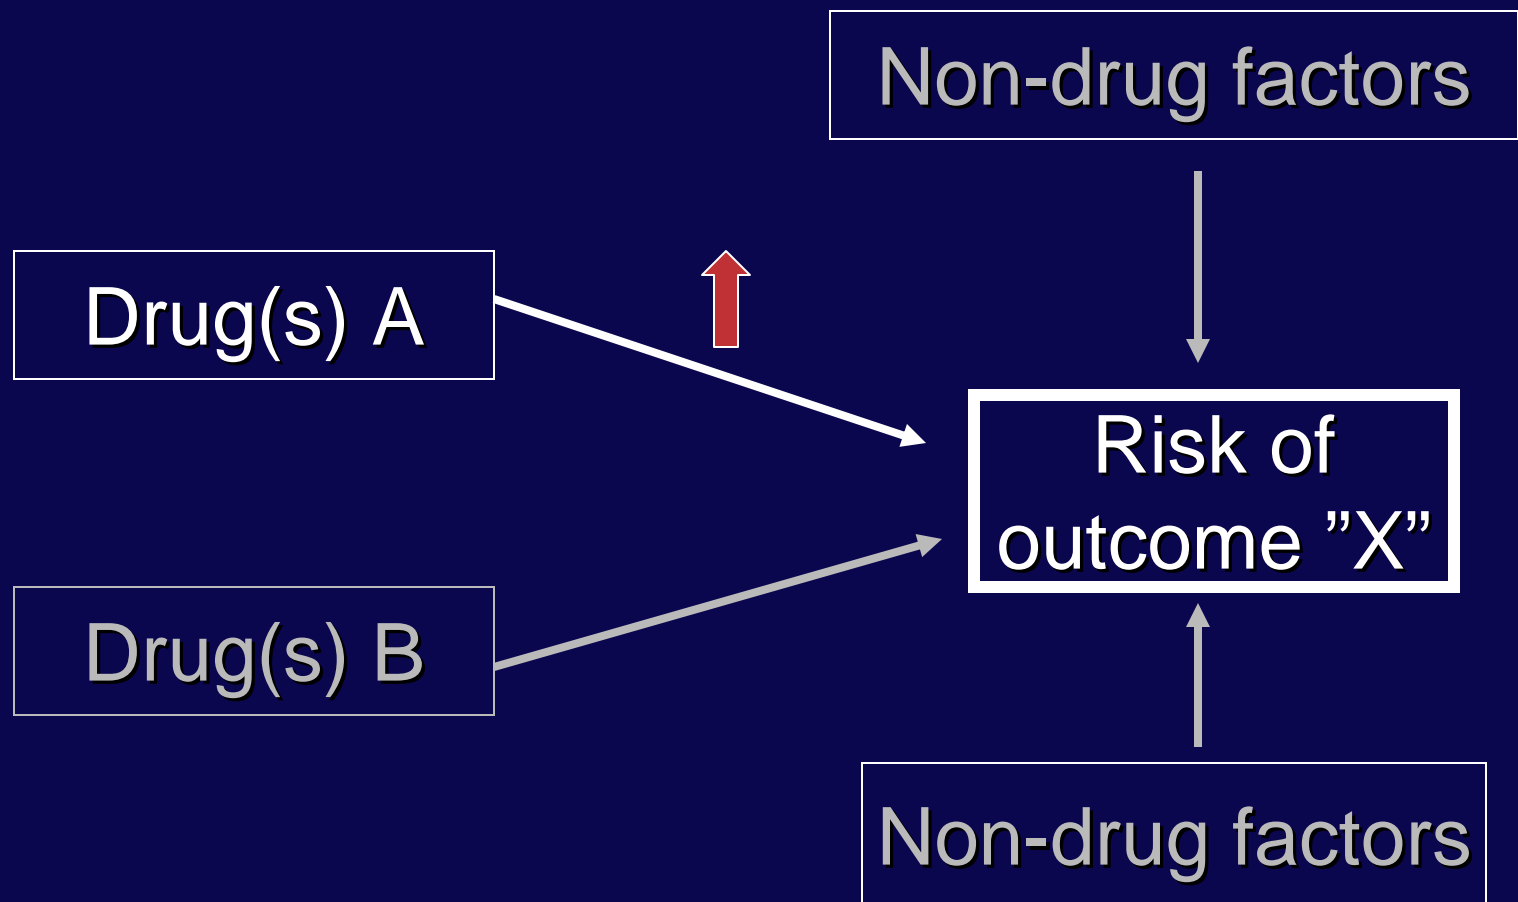

# Enthusiasm for a treatment as a function of time since first entering clinical testing

Enthusiasm

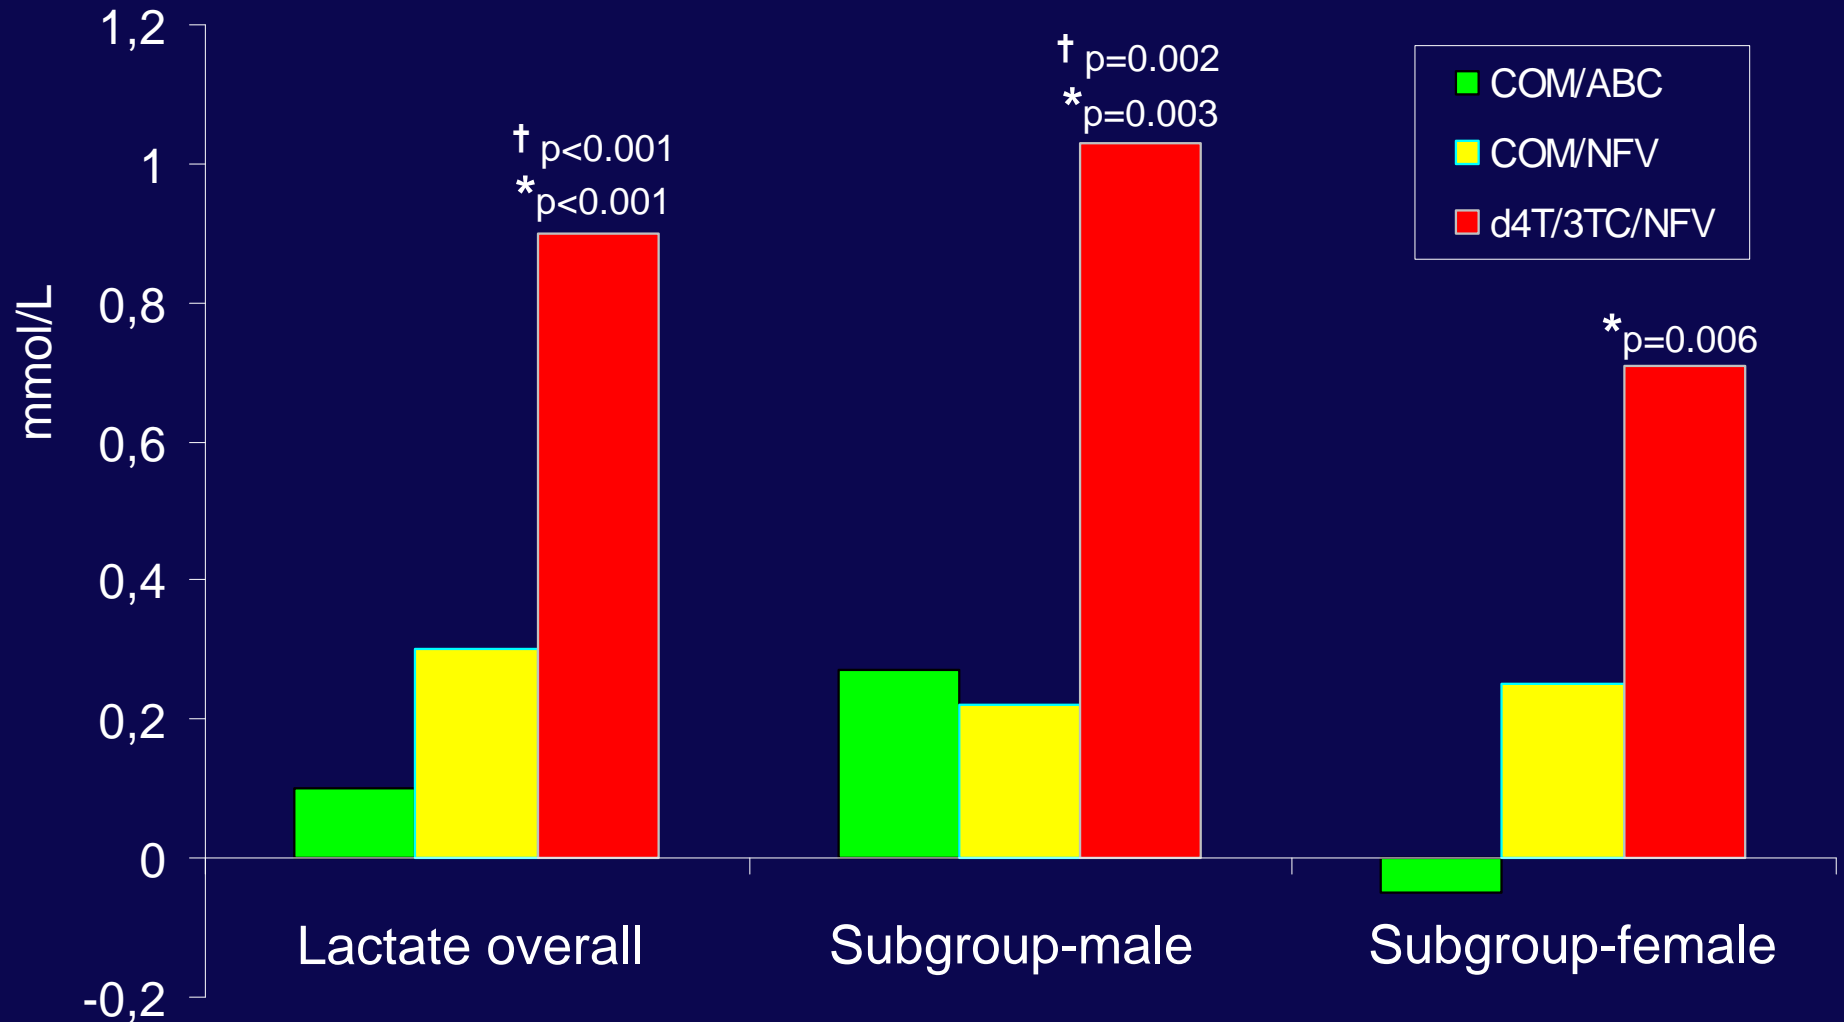

Time since initiation of phase I trials (years)

# Disentangling a drug effect

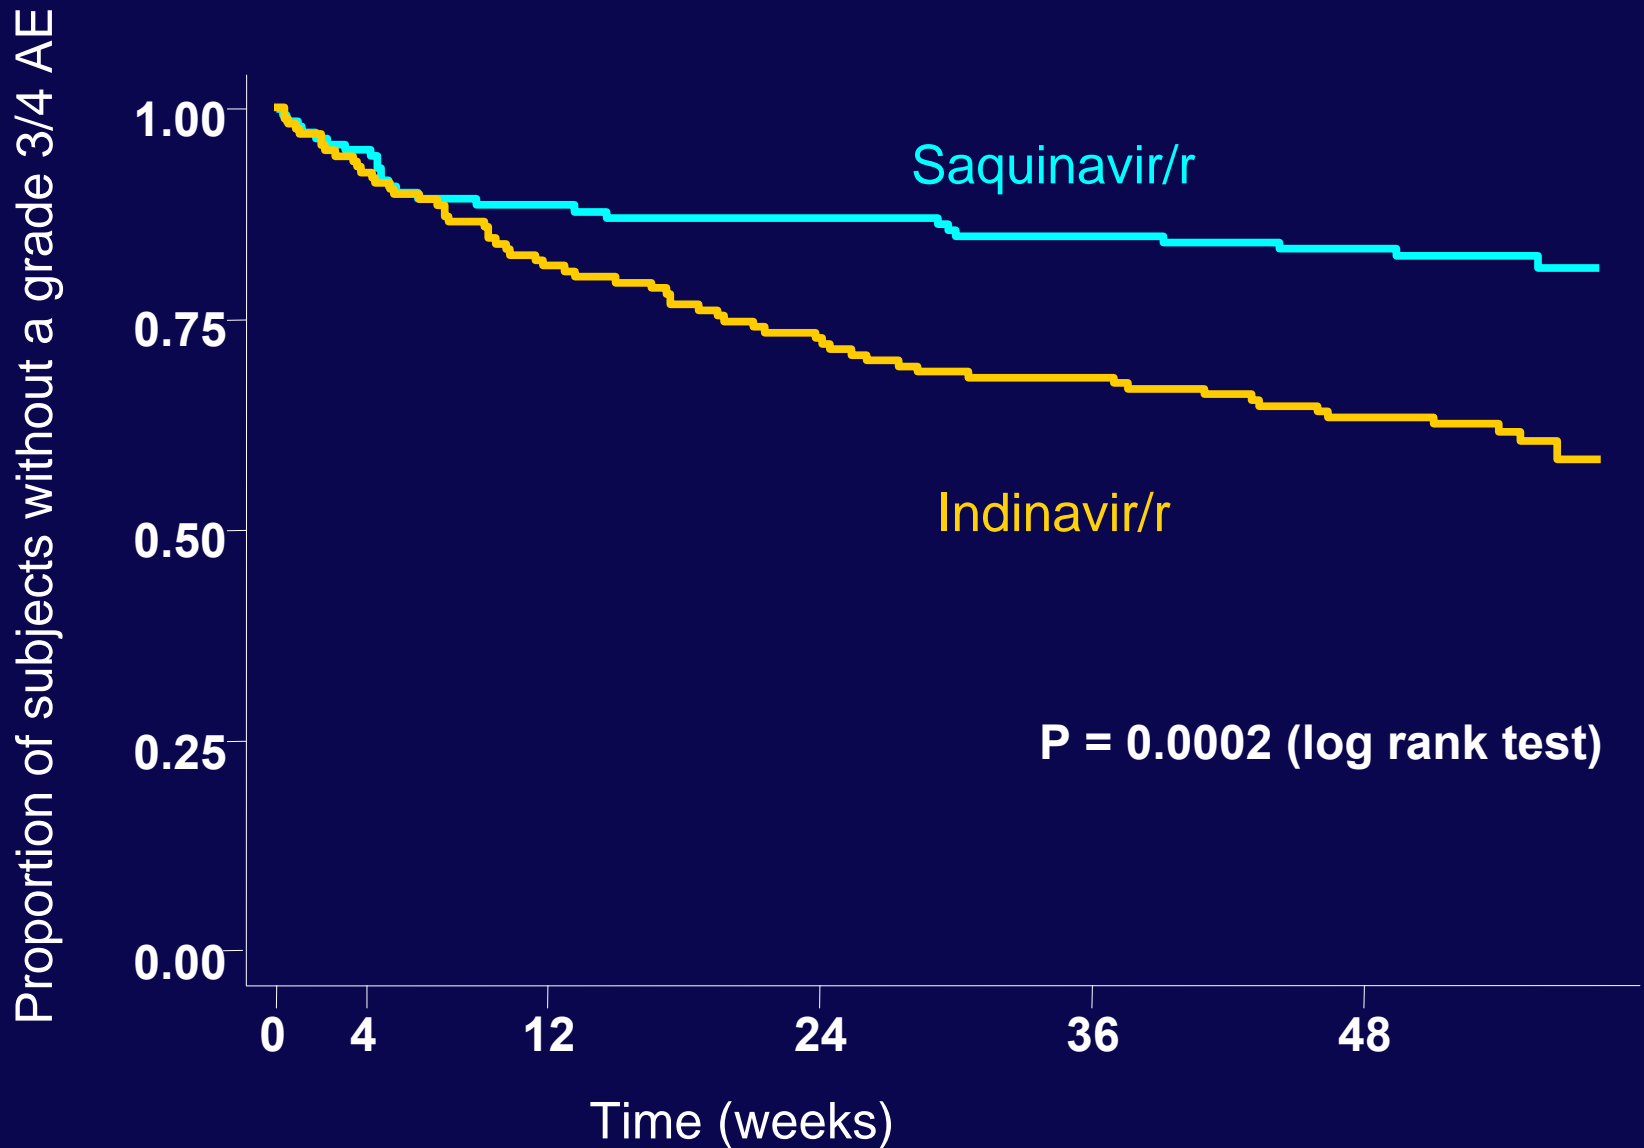

# ART naïve patients: Mean lactate values at 48 weeks ( $\Delta$ from BL)

\* p-value as compared to ABC/COM  
COPENHAGEN HIV PROGRAMME  
 $\dagger$  p-value as compared to COM/NFV

# Time to first severe drug-related AE

# Time to first severe drug-related AE

# Time to first severe drug-related AE

# Stavudine but not abacavir associated with depletion of limb fat

## Changes in limb fat by dexa scan

**d4T/3TC/EFV** (n=32)      **ABC/3TC/EFV** (n=25)

N<sup>o</sup> pts      57      57      57  
\* 95% CI      **ITT= intent-to-treat analysis**

# Abacavir hypersensitivity reaction (HSR) and HLA haplotype

- Presence of HSR and HLA-B\*5701 status:
  - B\*5701 pos: 14/18 (78%)
  - B\*5701 neg: 4/167 (2%)
- Reduction of prevalence of HSR by denying patients with HLA-B\*5701, HLA-DR7, HLA-DQ3 abacavir:
  - 9% to 2.5%

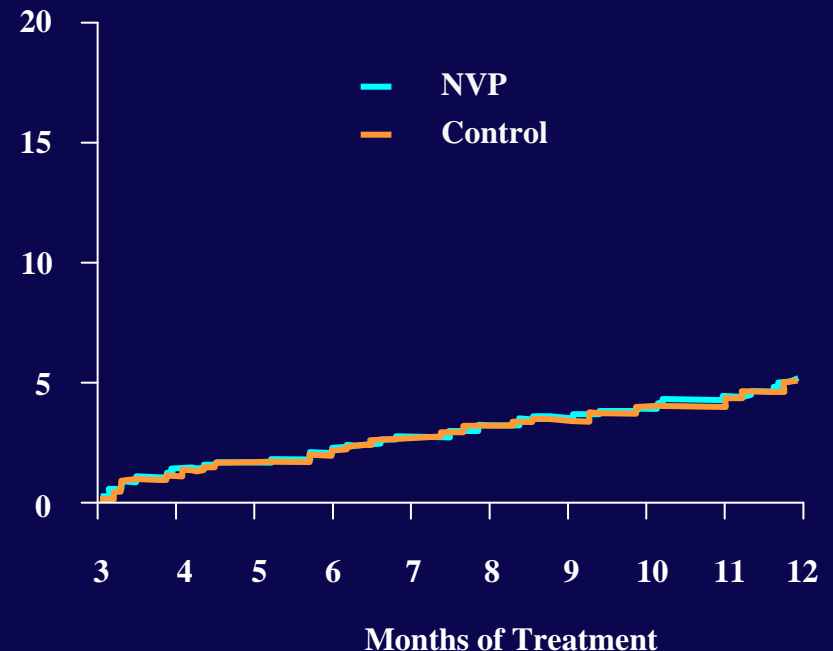

# Time to Onset of *Asymptomatic* ALT or AST >5 x ULN on NVP in *Controlled Trials*

0-12 Months

3-12 Months

**NVP (n = 1731)**

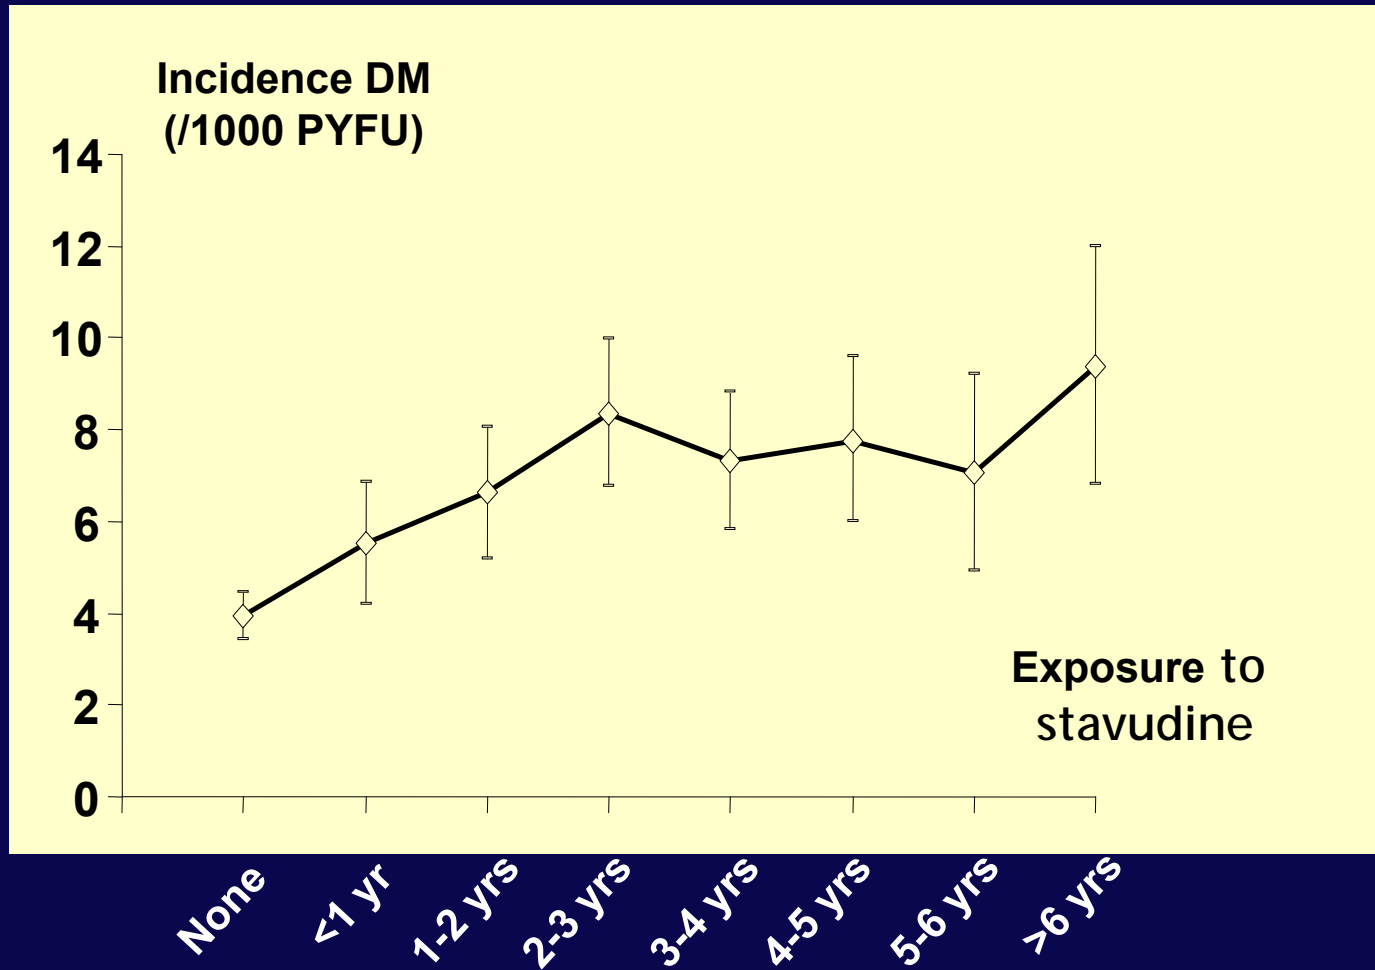

**Control (n = 1912)**

# The "conundrum" of using cART

- Allow persons to get older
  - De-masking other HIV-associated disease processes
    - eg. HBV, HCV
  - Allow the normal aging process to manifest itself clinically
    - dementia, cancers, CVD, hypertension, diabetes, body shape changes, etc
  - Exacerbate AEs of cART that interacts with the normal aging process

# Incidence of DM and exposure to stavudine

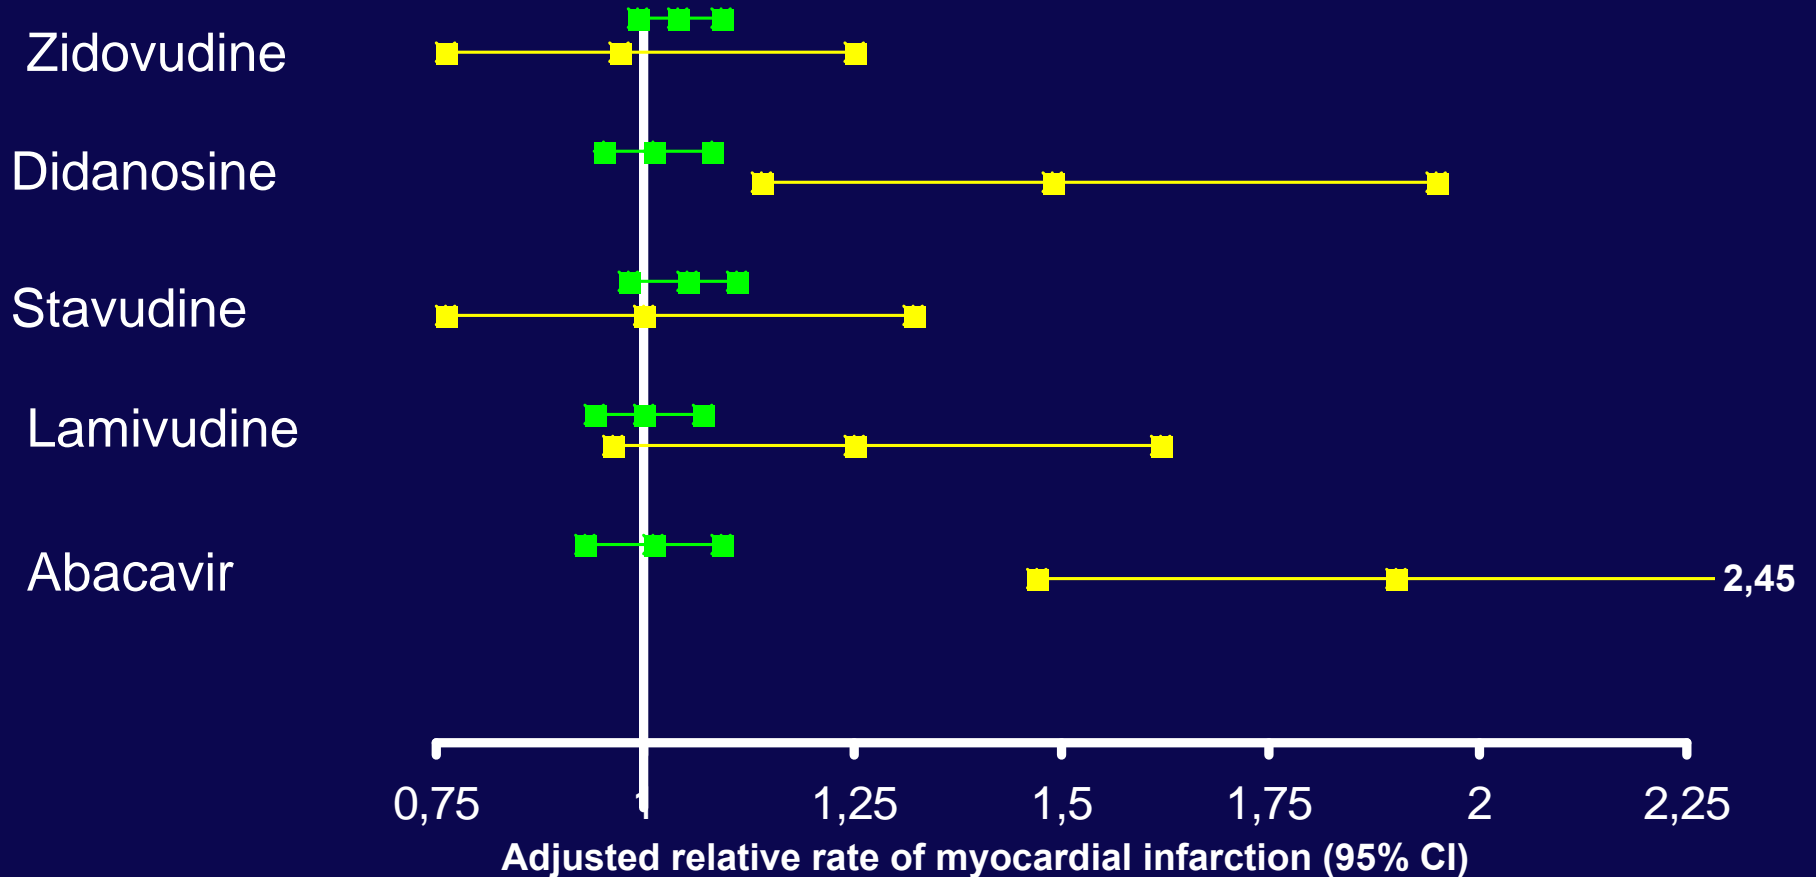

# Relative Rate of MI according to PI Exposure – Adjusted for NNRTI

★: Adjusted for sex, age, cohort, calendar year, prior CVD, family history of CVD, smoking, body-mass index, NNRTI exposure

# NRTIs and risk of myocardial infarction

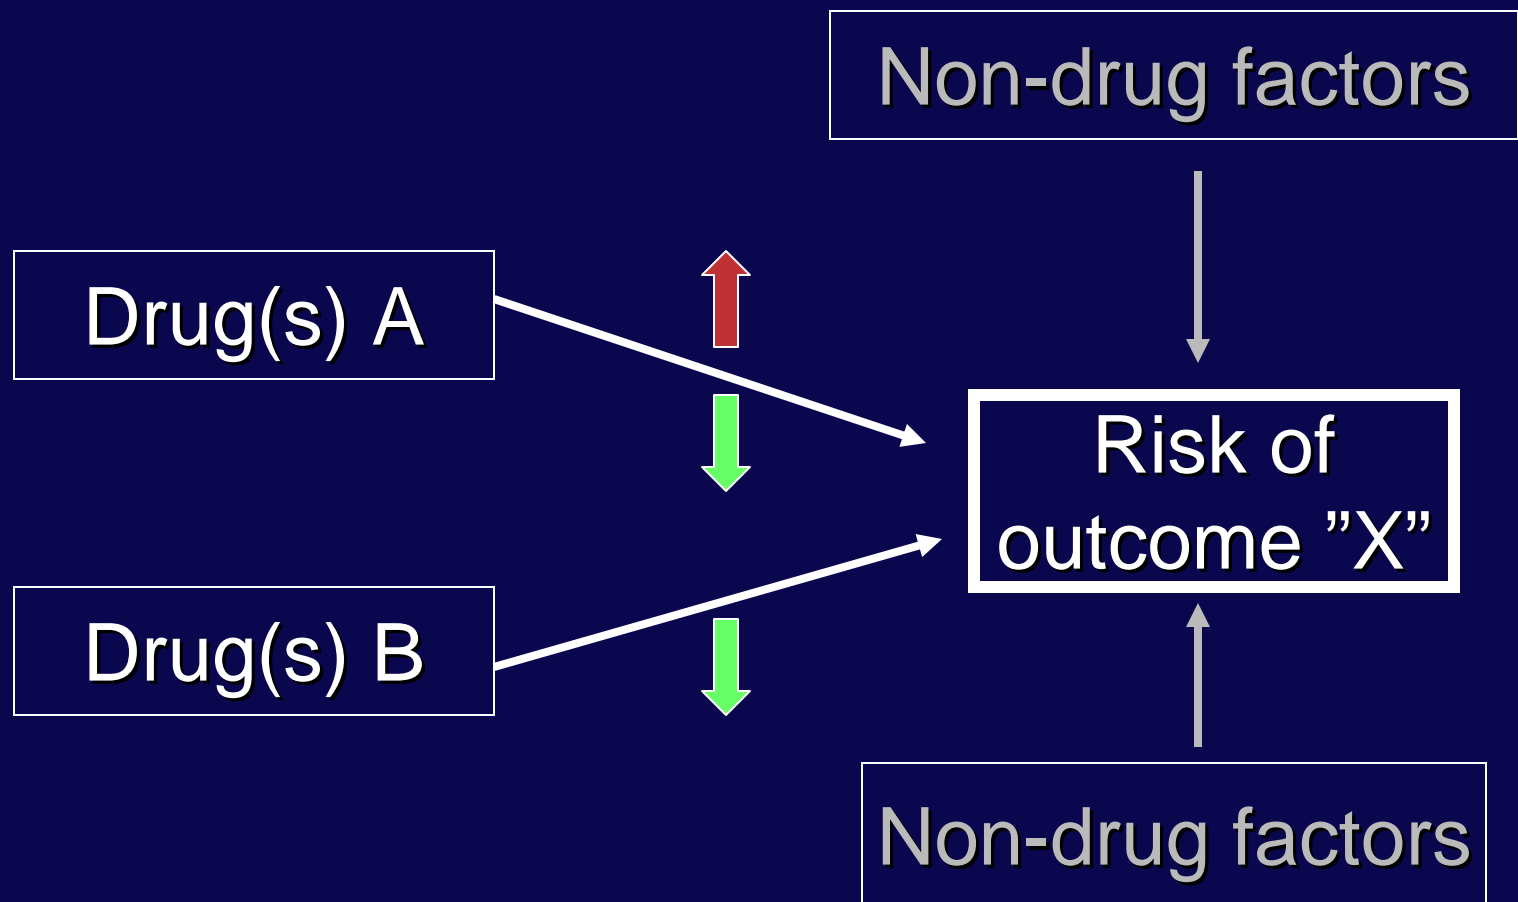

## cumulative and current/recent use

— Cumulative (1 yr, adjusted for recent)

— Recent (adjusted for cumulative)

# Disentangling a drug effect

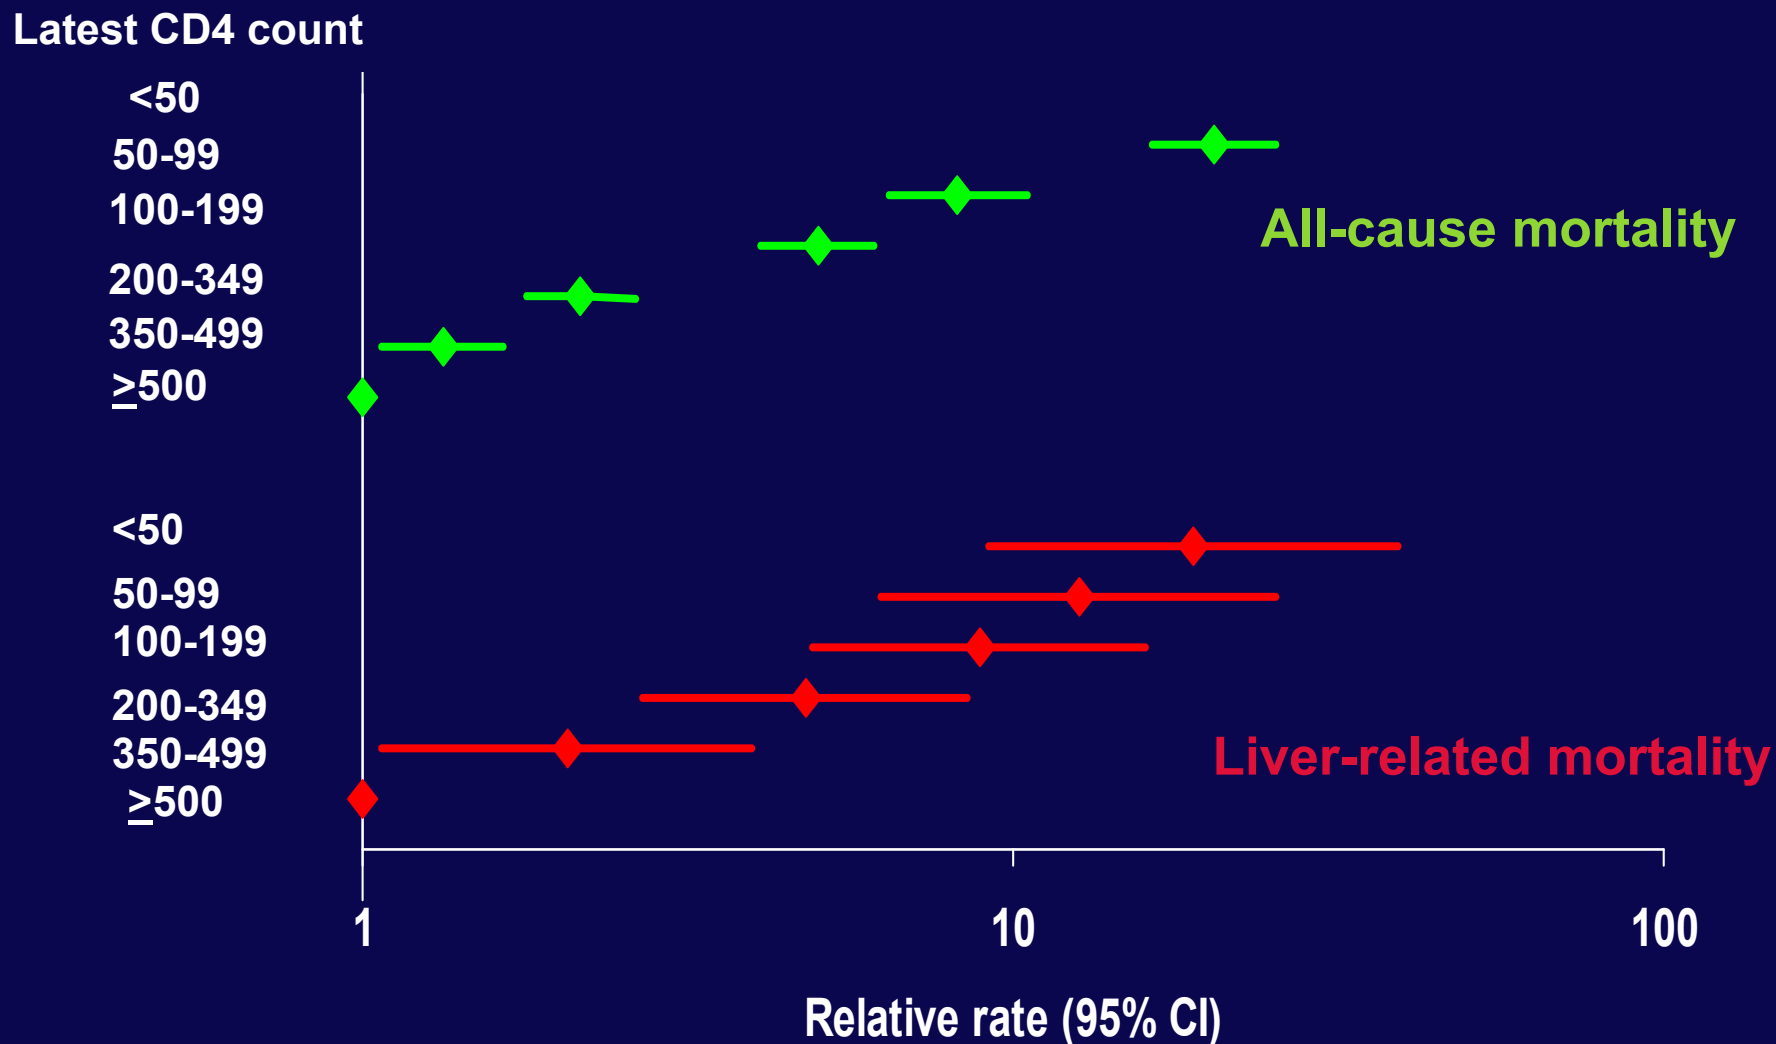

# Deaths in D:A:D

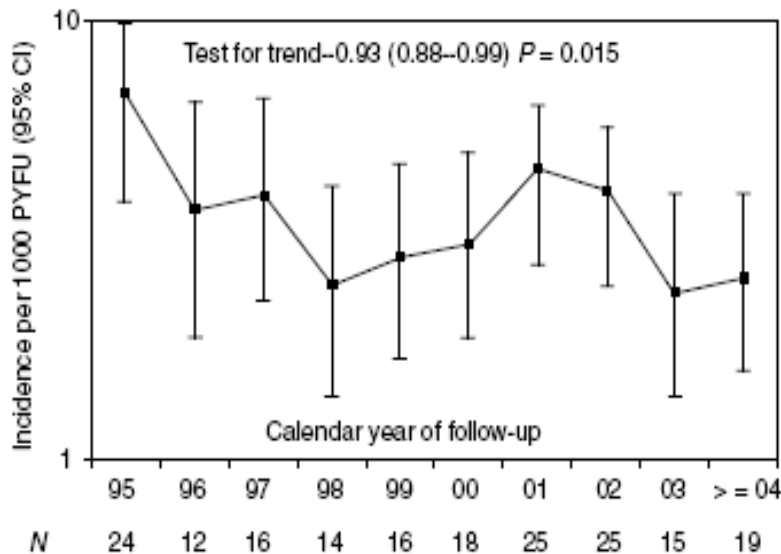

## Multivariable relationships with death rate

### Latest CD4 count

# Relationship between combination antiretroviral therapy and liver-related deaths: benefits and potential harm

Calendar time trends\*

Risk per year of exposure to ART in recent years\*\*

## Univariable

All CD4 cell strata

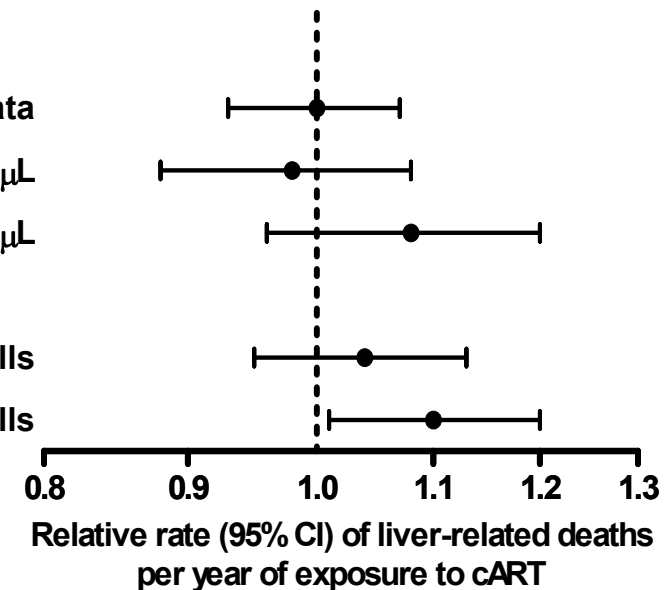

CD4 cells above 200/ $\mu$ L

CD4 cells below 200/ $\mu$ L

## Multivariable

Nadir CD4 cells

Latest CD4 cells

\* D:A:D study: Weber *et al*, 13<sup>th</sup> CROI, 2006

# Glomerular filtration rate (GFR) over time by baseline GFR: Impaired baseline GFR improved

Mean GFR change (ml/min/1.73m<sup>2</sup>)

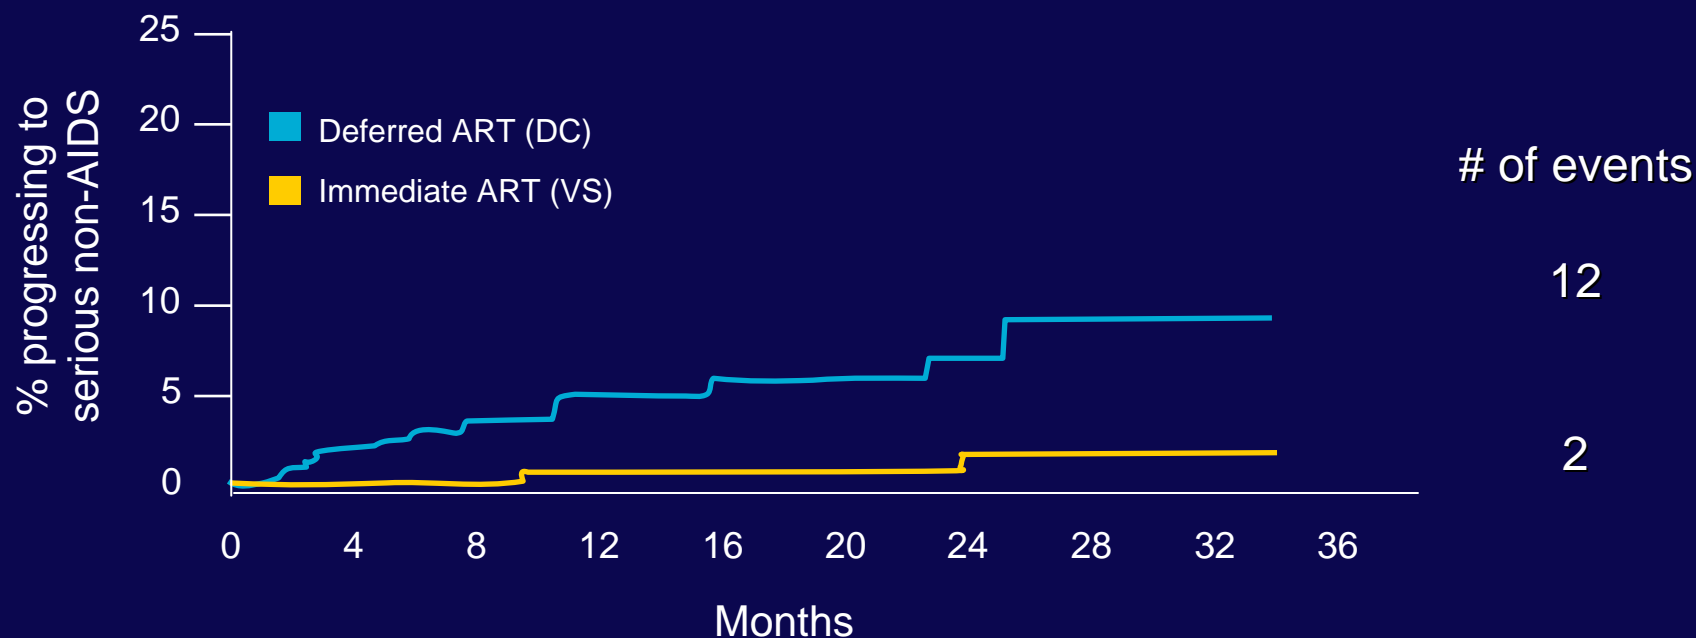

# Risk of major CVD events in SMART: intermittent (DC) vs continuous (VS) ART

DC	2752	1306	713	379	10
VS	2720	1292	696	377	10

# Subgroup in SMART either naïve or not currently on ART: early versus deferred

## Serious Non-AIDS

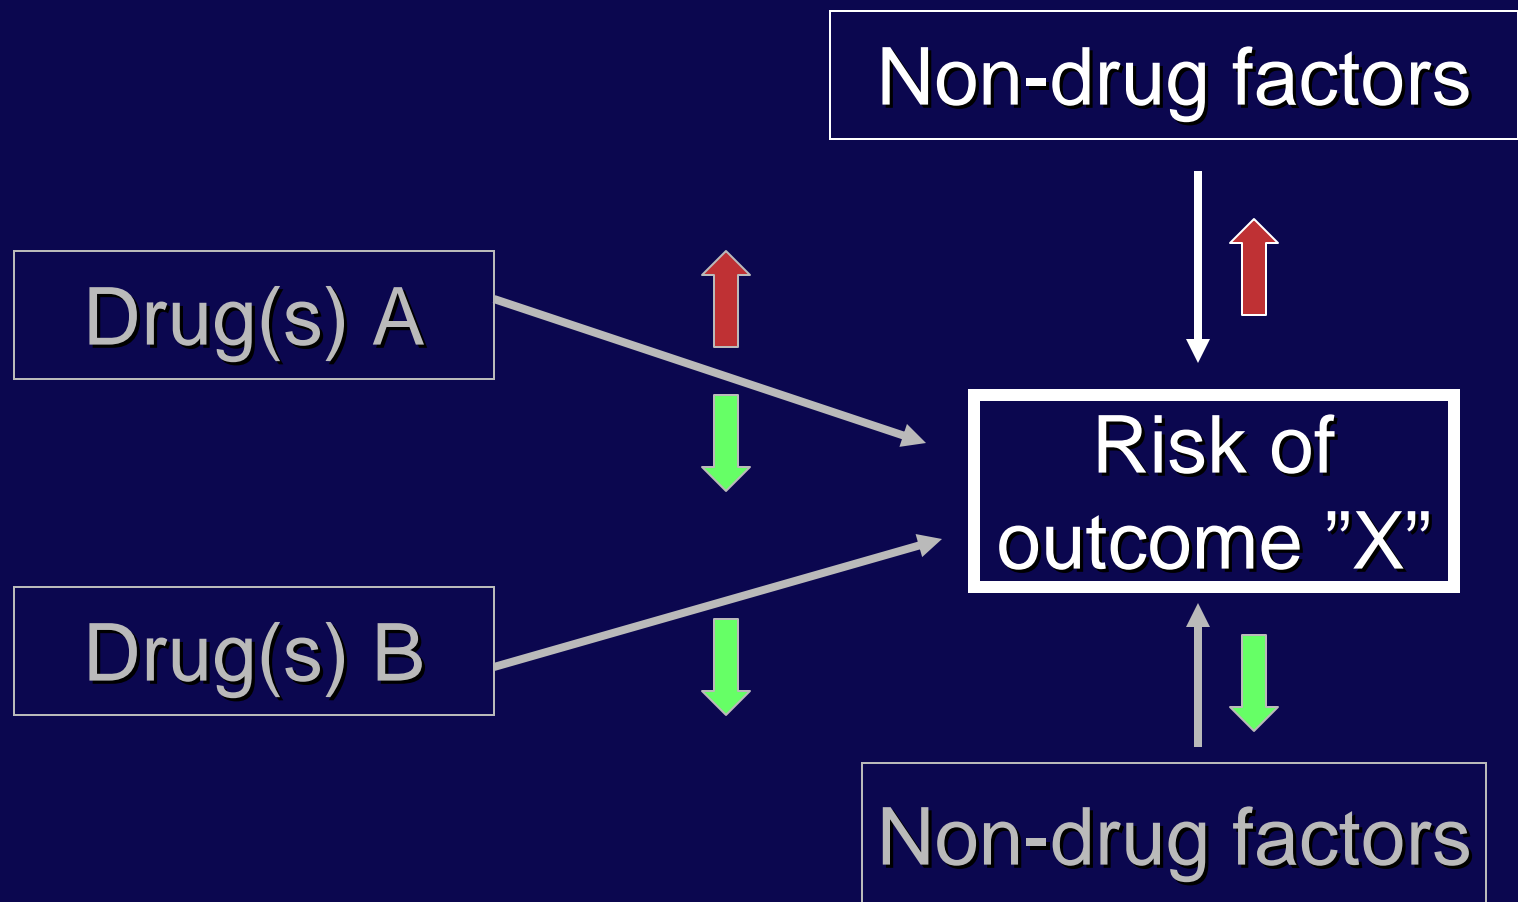

No. at risk

Def. ART	228	189	159	128	96	73	59	36	27	24
Imm. ART	249	210	180	145	125	106	80	58	44	36

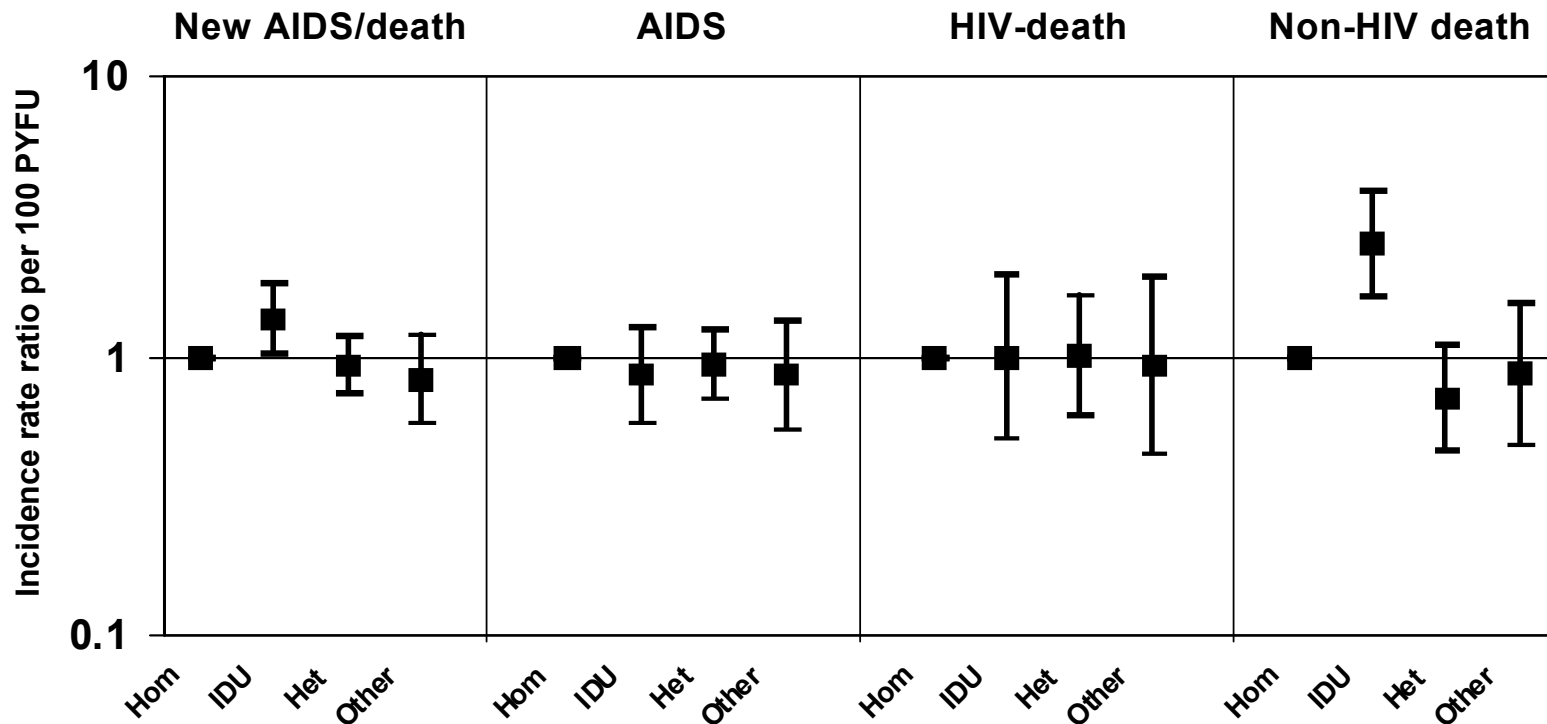

## Serious non-AIDS events: complication of using ART but also from untreated HIV

- Decompensated liver disease
- End-stage renal disease
- Cardiovascular disease
- Non-AIDS defining cancers

# Disentangling a drug effect

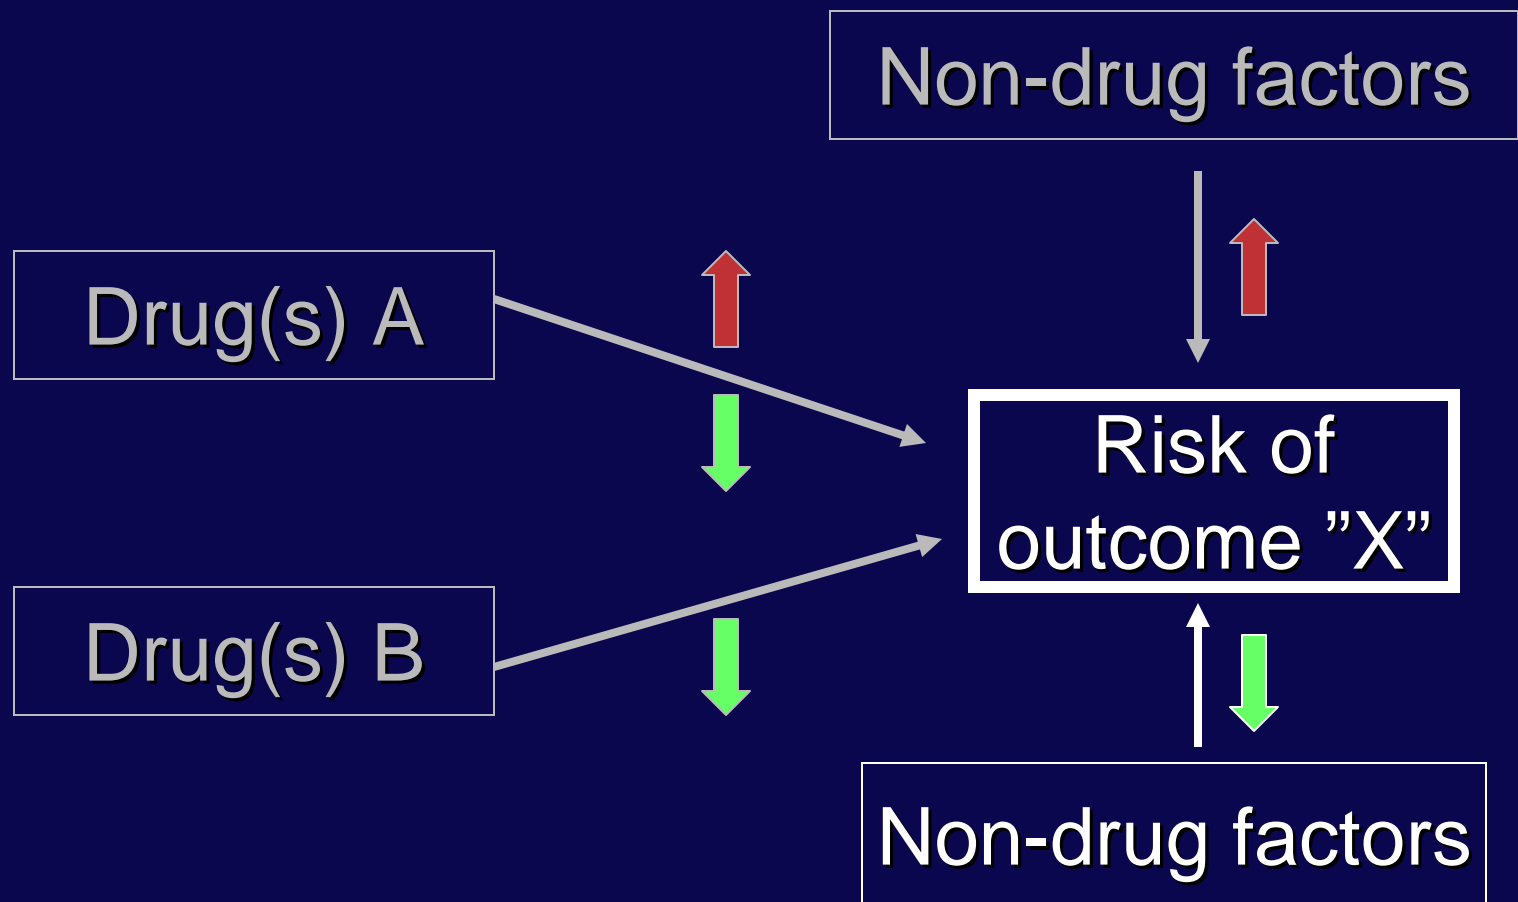

# Adjusted incidence rate ratios of new AIDS/death, AIDS, HIV or non-HIV death after starting HAART

Adjusted for Age, AIDS, prior ARV treatment, HAART regimen started, Hepatitis C status, date started HAART and both CD4 and viral load as time-updated variables

# Disentangling a drug effect

# Young age makes adverse influence on risk of myocardial infarction from using PI trivial

Events	0	2	2	15	55	80	80	75	53	34	25	24	445
PYFU	275	2322	7408	18012	32551	30991	18600	12209	7583	4024	1916	1413	137310

\*: Adjusted for sex, age, cohort, calendar year, prior CVD, family history of

# Laboratory based AEs

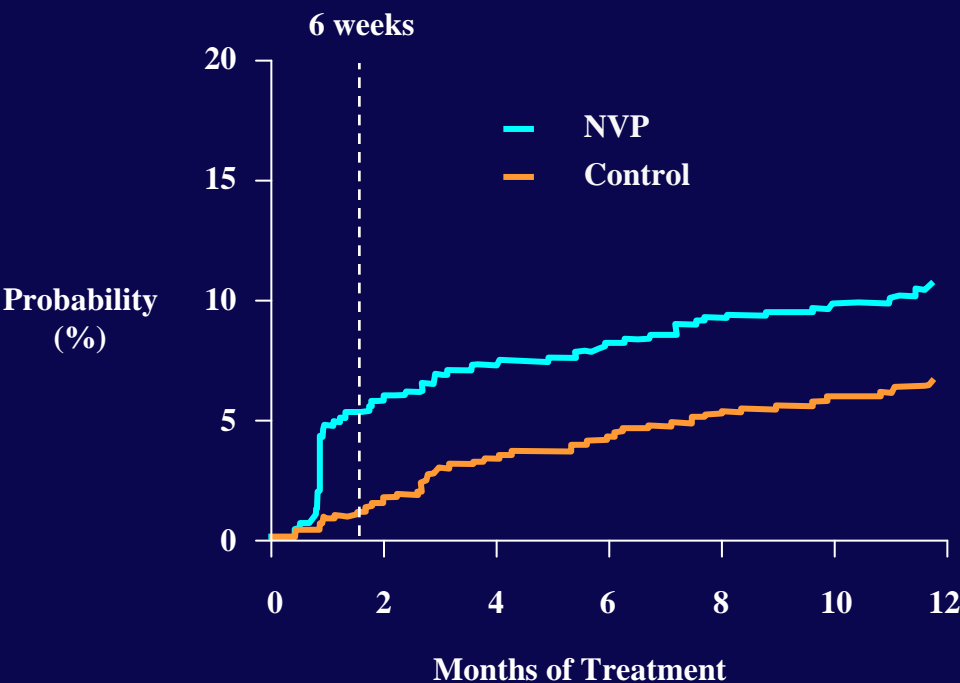

# Laboratory defined adverse effect endpoints: grading

# Time to Onset of *Asymptomatic* ALT or AST >5 x ULN on NVP in *Controlled Trials*

0-12 Months

3-12 Months

**NVP (n = 1731)**

**Control (n = 1912)**

Laboratory defined  
adverse effect endpoints:  
already abnormal (e.g. viral hepatitis)

# Laboratory defined adverse effect endpoints: timing of measurement

Laboratory defined  
adverse effect endpoints:  
clinical detectable consequences

# Critical issues in pharmacovigilance

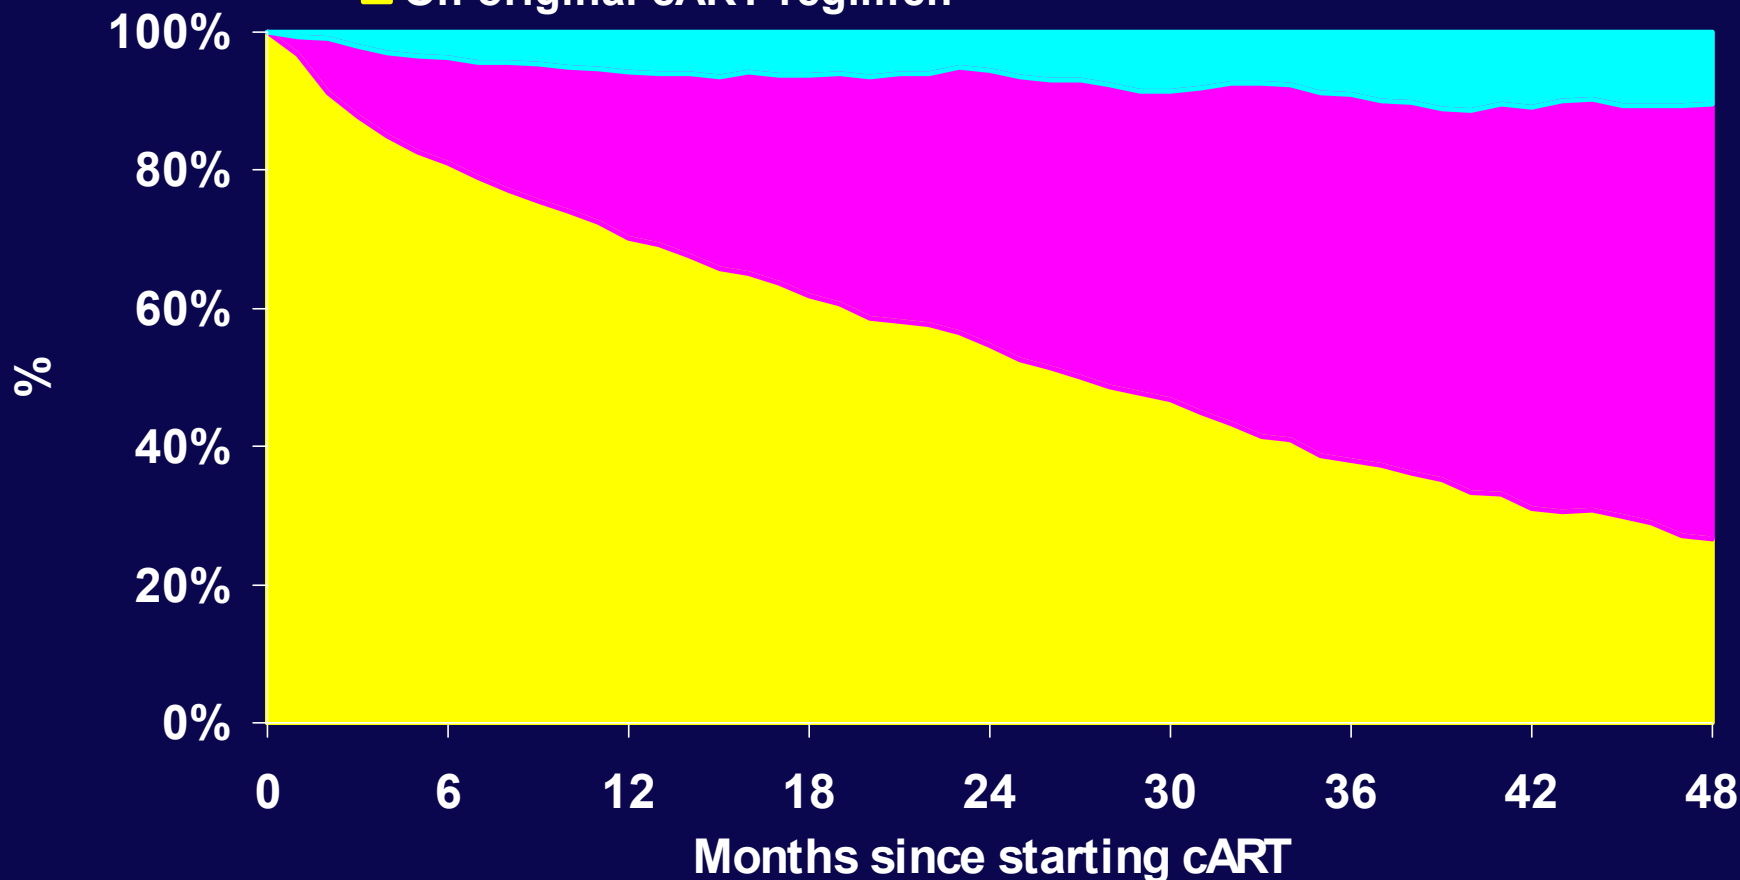

- Prioritize collection of well defined events
  - Clear & simple case definition
  - Easy to ascertain & clinically important (to patient, his/her provider and treatment programme)
    - Severe clinical disease (fatal or non-fatal)
    - Reasons for treatment switch
    - (laboratory defined endpoints)
  - Keep track of emergence relate to starting drug (early vs late)
- Have procedures in place to capture emerging problems
  - Spontaneous reporting (UMC)
  - Causes of death

## Serious non-AIDS events: complication of using ART but also from untreated HIV

- Decompensated liver disease
  - Liver (pre)coma or transplantation
- End-stage renal disease
  - Permanent dialysis or kidney transplantation)
- Non-AIDS defining cancers
  - Pathology reports or clinical obvious
- Cardiovascular disease
  - Dundee classification (WHO Monica)

# Changes to a first combination ART regimen

- Off all antiretrovirals
- Any change to original HAART regimen, remaining on treatment
- On original cART regimen

COPENHAGEN HIV PROGRAMME

EuroSIDA: Mocroft et al, AIDS Research Hum Retro, 2005

# Quality versus quantity

# Summary

- ARVs = millions of life-years gained
- All ARV induces AEs
- All AEs are not induced by ARVs
- PV system
  - Events: Clinical important, easy to define & ascertain
    - Keep it simple but consistent and harmonised
  - Keep things in perspective
    - Frequency
    - Benefits
