<https://forumresearch.org/liver-forum/liver-forum-meetings/1744-liver-forum-12>

# **April 22-23 Meeting Theme**

## **“Show us the data”**

# Roadmap

- Improving the reference standard
- Opportunities & challenges
- Diagnostic COU
- Prognostic COU
- Predictive/monitoring COU

# Liver Biopsy Reads: Statistical Issues

Amrik Shah

Karma Statistics, LLC

# Underestimation of Treatment Effect Size

- Reading Error always dilutes Treatment Effect size
  - only "accurately read" slides contribute to effect size
- From published/observed kappas,
  - Fibrosis sensitivity of 0.7 is reasonable

Example: NASH trial setting focusing on Fibrosis endpoint

Endpoint is binary, BUT "improve", "stable" and "worsen" buckets must be considered when assessing impact of reading error

# Key Takeaway Learnings

- Endpoint based on Biopsy Reads has severe limitations and not appropriate for assessing drug efficacy.
- Impact of reading error CANNOT be overcome by increasing sample size
  - Doubling sample size still yields same % Delta*
- If forced to stick with Biopsy Reads, the dilution of effect size MUST be considered for Benefit-Risk assessment.
  - *Dilution may range from 30% - 60%*

# **Digital Pathology with AI analyses of tissue slides is already used in clinical practice and trials: recent examples**

- **Prostate Cancer diagnosis**
  - Paige Prostate AI software - Paige (FDA approved)
  - Galen Prostate AI software – Ibex (approved in EU)
- **Breast Cancer diagnosis**
  - Galen Breast Solution AI model – Ibex (approved in EU)
- **Detection of Breast Cancer metastases in lymph nodes**
  - Paige Breast Lymph Node, AI digital tool

# Wholistic Assessment of Biomarker Response

## Overview of bi-directional NIT changes per study arms

## Assessment of consistency of NIT change at the *per patient* level

# Conclusions

---

A range of tractable biomarkers are available to support drug development in NASH.

When considering the use of biomarkers in drug development, it is essential to consider the specific **Context of Use** (and population/setting) that is being addressed.

There remains a need for more sensitive and specific, independently validated and qualified biomarkers for use in NAFLD drug development.

Progress to date:

1. **Diagnostic CoU:** LITMUS and NIMBLE are bringing clarity and objectivity to biomarker performance - still room for innovation to identify better biomarkers.
2. **Pharmacodynamic/Response CoU:** remains an area where there is a lack of consistency but the RCTs to date have helped generate important data to support biomarker utility.  
**We are now better placed to build consensus and *standardise NIT selection and the consistency of NIT reporting as study endpoints to support NASH drug development.***
3. **Surrogacy potential:** It is notable that there is an expanding dataset to demonstrate that fibrosis biomarkers have prognostic value and change with progression/regression of disease, potentially with greater inter-test consistency than histology.

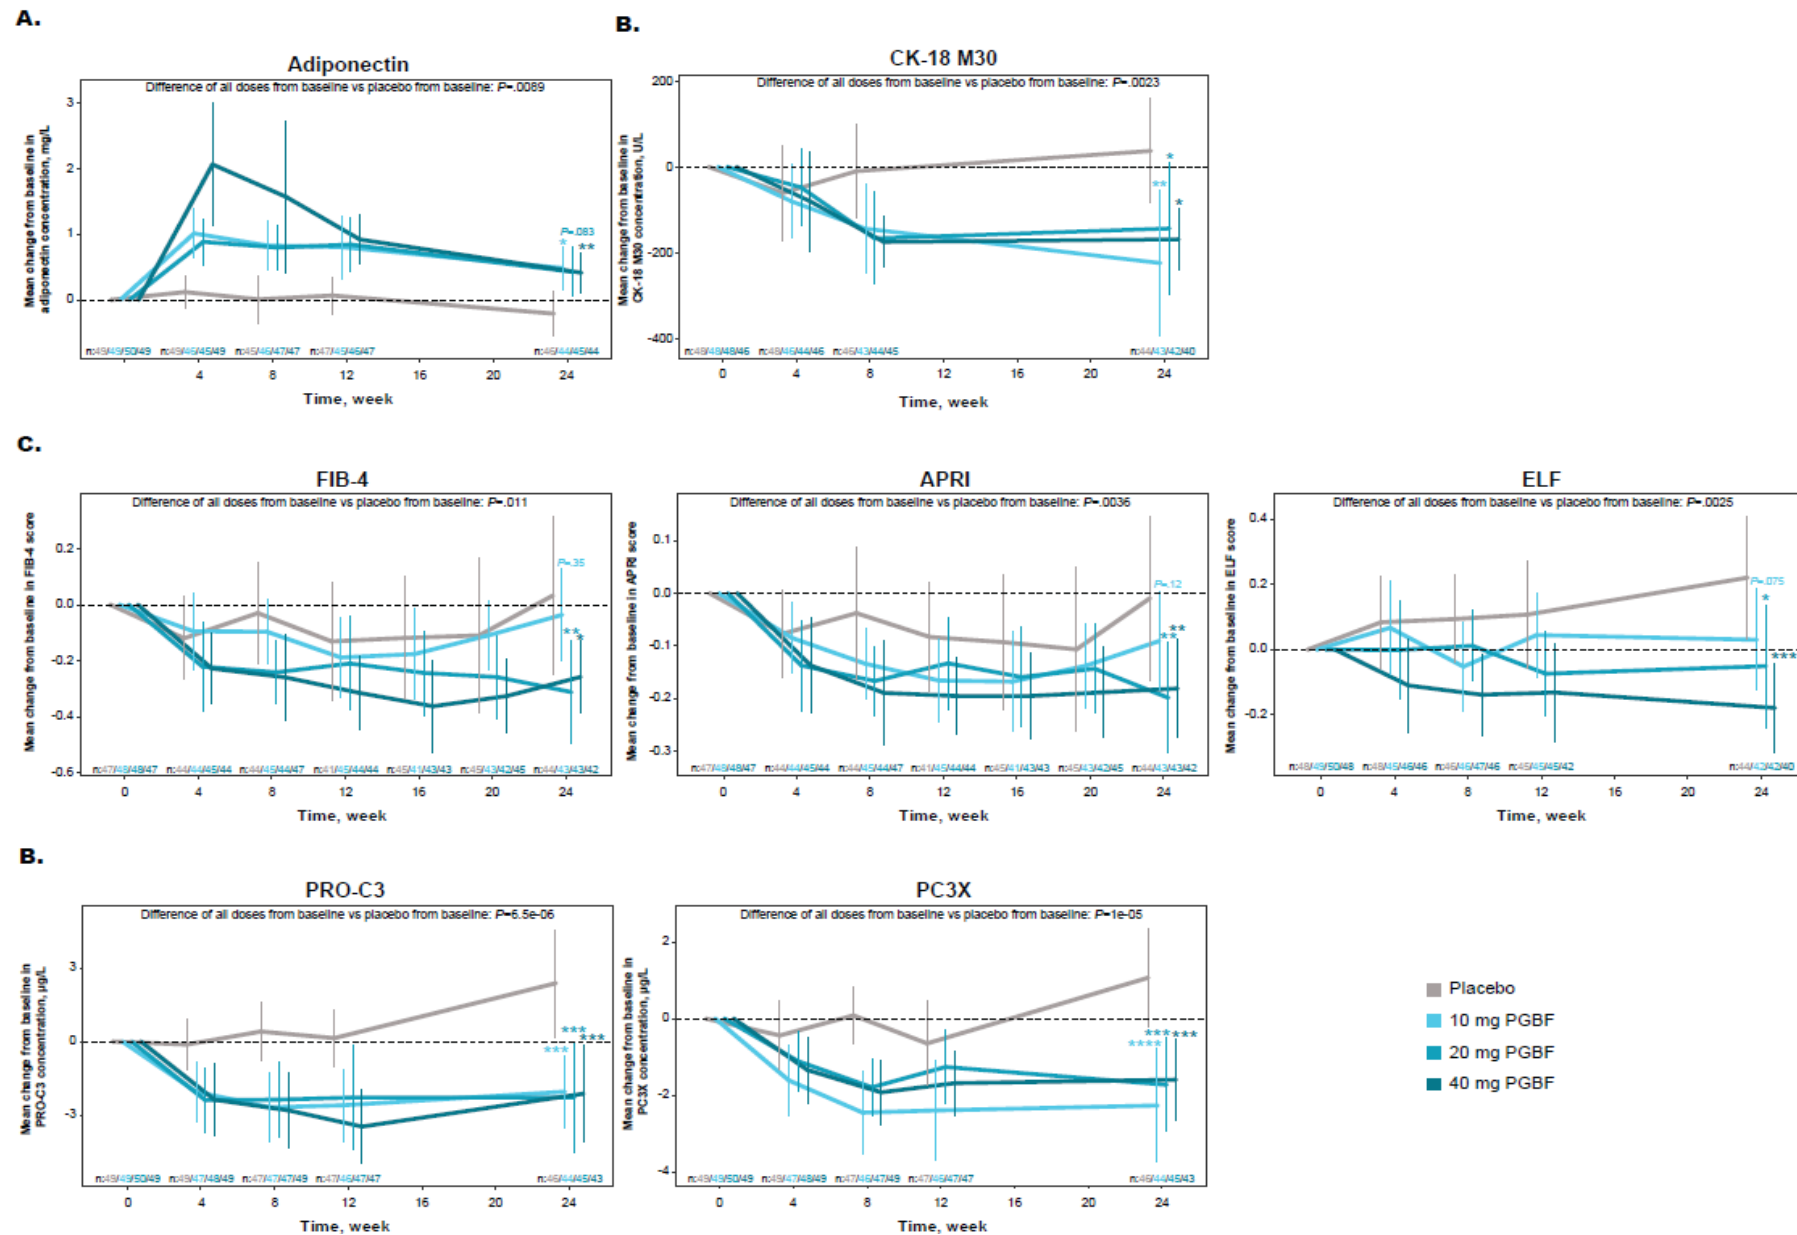

# Liver forum 12

## Effects of pegbelfermin on NIT's for NASH in a Phase 2b study: Falcon-1

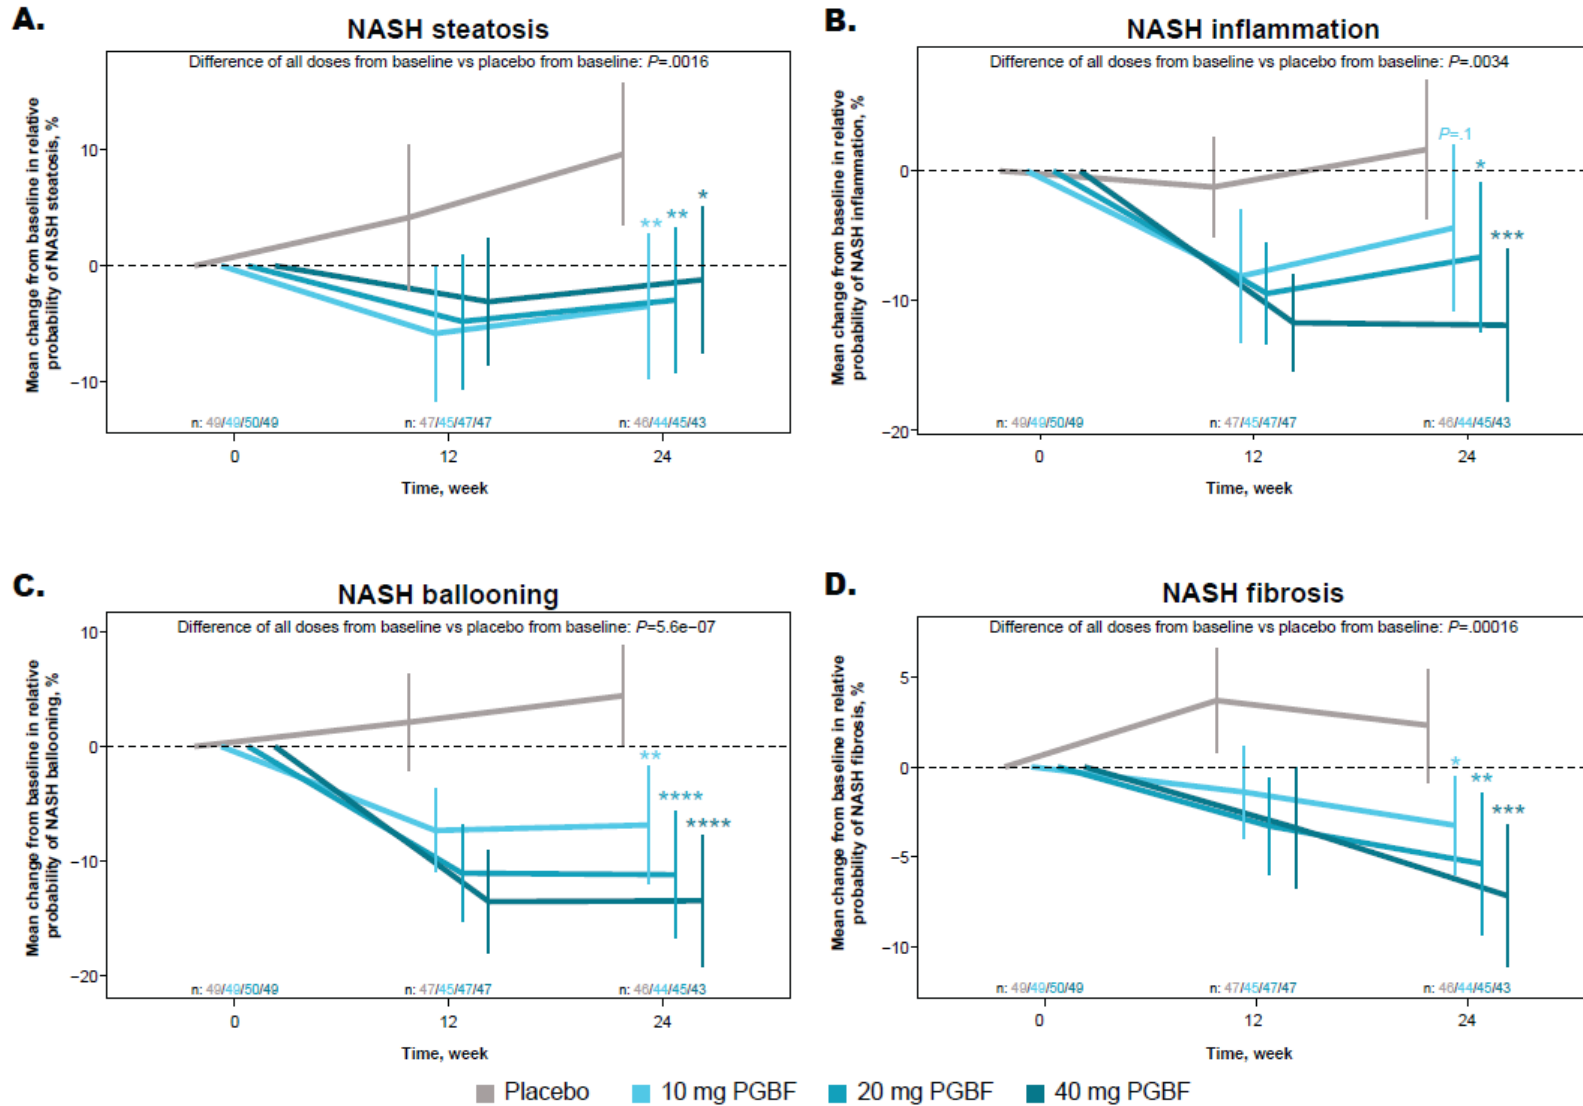

April 23<sup>rd</sup> 2022

Anne Minnich

# PGBF modulates blood biomarkers of liver injury and fibrosis

# Somasignal NASH bundle

# Clustering of correlation coefficients for biomarkers and histological assessments

Pairwise week 24 correlation

Fibrosis NIT's cluster well together but not with the primary endpoint  
 Soma-NASH = only NIT to cluster with primary endpoint

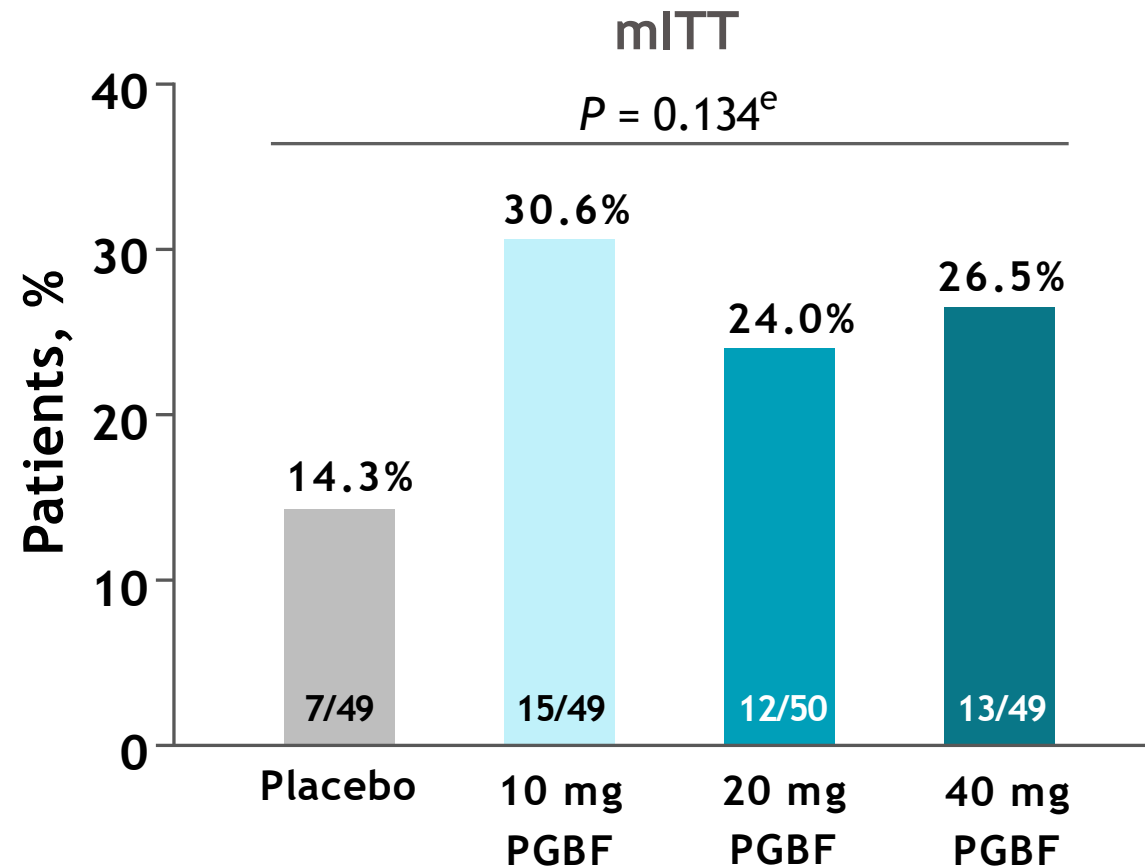

# Concordance analysis between primary endpoint and week 24 biomarker responses

# Primary Endpoint

At Week 24:  $\geq 1$  stage improvement in fibrosis<sup>a</sup> without worsening of NASH<sup>b</sup> **OR**  
NASH improvement<sup>c</sup> without worsening of fibrosis<sup>d</sup>

<sup>a</sup>Improvement of fibrosis =  $\geq 1$  stage decrease in NASH CRN fibrosis score; <sup>b</sup>Worsening of NASH = increase in NAS by  $\geq 1$  point; <sup>c</sup>NASH improvement =  $\geq 2$  point decrease in NAS with contribution from  $> 1$  NAS component; <sup>d</sup>Worsening of fibrosis =  $\geq 1$  stage increase in NASH CRN fibrosis score; <sup>e</sup>Cochran-Armitage trend test across proportions of responders in the treatment groups at a 1-sided 0.05 level of significance provided at least 80% power if 160 patients were randomized 1:1:1:1. mITT, modified intent-to-treat; NASH, nonalcoholic steatohepatitis; PGBF, pegbelfermin.

# Next steps

- Today's Session 2
- Ongoing, iterative discussions (plenary)
- Working Group (focused)
  - Compile/synthesize data for each COU
  - Present the case
