

# The Road to Development of Preventive and Therapeutic Treatments for Human Herpesvirus 6B (HHV-6B)

Josh Hill, MD Associate Professor, VIDD, Fred Hutchinson Cancer Center Associate Professor, Division of Allergy and Infectious Diseases, UW Seattle, WA, USA

### **UW** Medicine

# Epidemiology and Disease Associations

# History of discovery and naming

HHV-6 first identified during cultivation of peripheral blood mononuclear cells from patients with lymphoproliferative disease and AIDS. **First named Human B-Lymphotrophic Virus (HBLV)** Name changed to HHV-6 Subtypes identified: HHV-6A & HHV-6B 1986 1987 2006 1992 2000

**Fred Hutchinson Cancer Center** 

986

#### HHV-6A & HHV-6B recognized as distinct species

2012

# Human Herpesvirus 6B

Identified as the cause of roseola infantum in 1988

Primary infection typically occurs during infancy

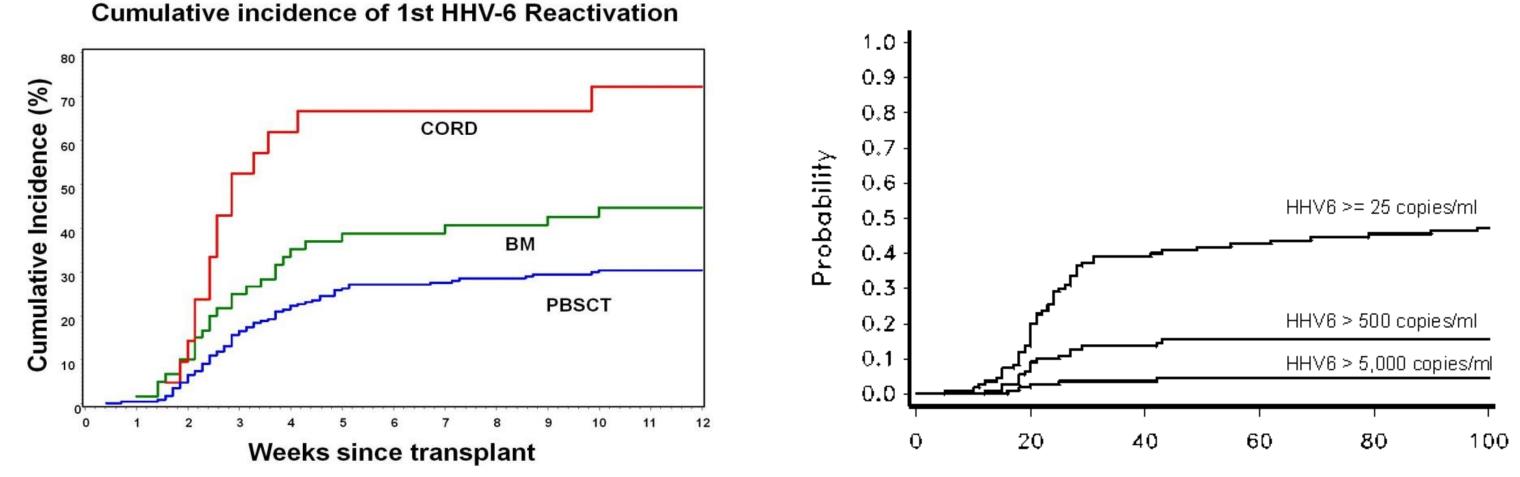

- Adult seropositivity is >95%
- Latency in a wide variety of host cells
- Reactivation may occur during immunosuppression

Ablashi et al, Arch Virol 2014 Zerr et al, NEJM 2005 De Bolle et al, Clin Microbiol Rev 2005

## HHV-6B after allogeneic hematopoietic cell transplant (HCT)

### HHV-6B viremia is common 2-6 weeks after HCT

### **Risk factors**

• Cord blood HCT, HLA mismatch, GVHD, steroids

Hill et al, Curr Opin Virol 2014 Zerr et al, BBMT 2012 Yamane et al, BBMT 2007

# **HHV-6B encephalitis**

Most common infectious cause of encephalitis post-HCT

- Affects 1-10% allogeneic HCT recipients
- Cord blood stem cell recipients particularly high risk
- Occurs early after HCT: median 21 days

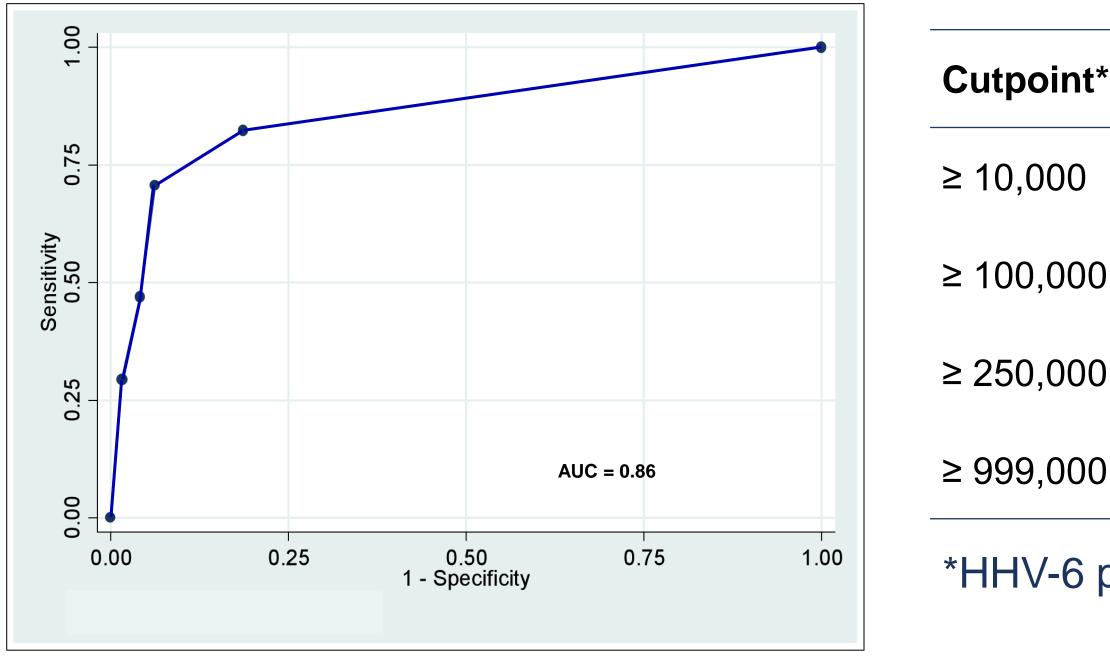

Patients without HHV-6 encephalitis

Patients with HHV-6 encephalitis

1500 2000

Schmidt-Hieber M, Haematologica 2011 Ogata et al, BMT 2017

## Plasma HHV-6 viral load correlation with HHV-6 encephalitis

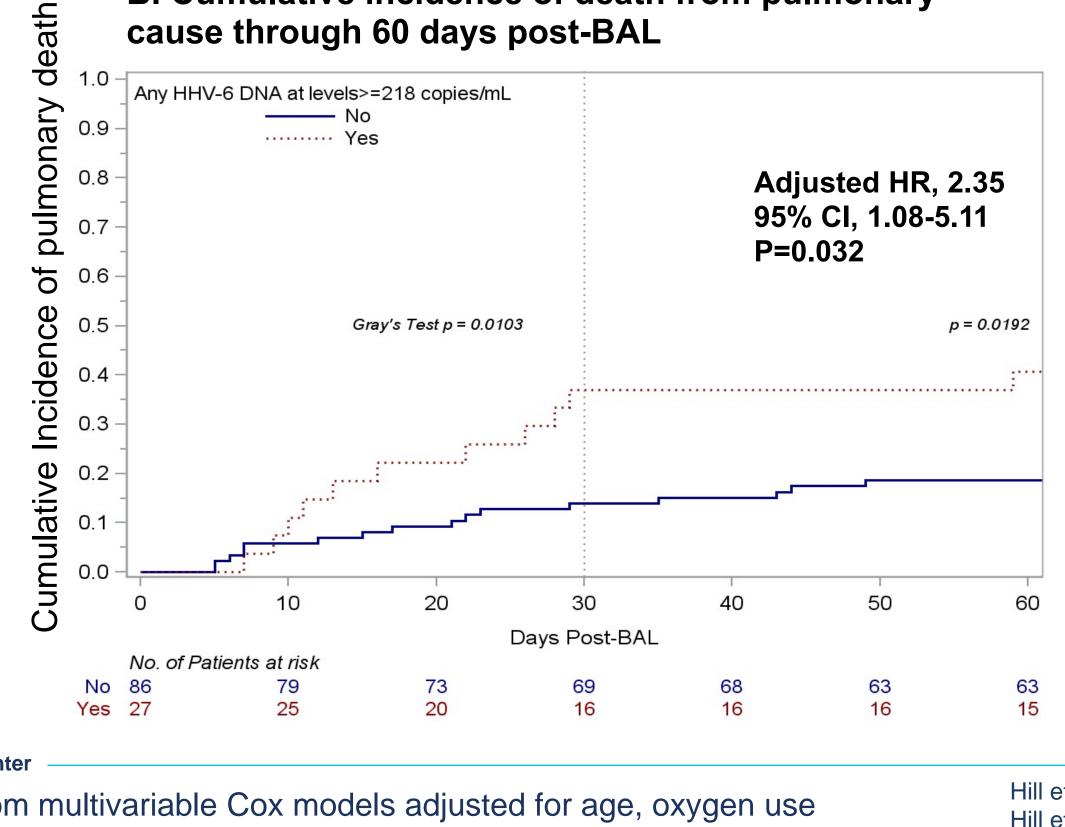

*	Sensitivity	Specificity	
	100%	81%	
)	71%	94%	
)	47%	96%	
)	29%	98%	

\*HHV-6 plasma viral load (copies/mL)

Hill et al, BBMT 2012

# HHV-6B in BAL fluid is associated with increased mortality after allogeneic HCT

**Fred Hutchinson Cancer Center** 

Hazard ratios (HR) are from multivariable Cox models adjusted for age, oxygen use (>2 liters by nasal cannula), and steroid use at the time of the BAL.

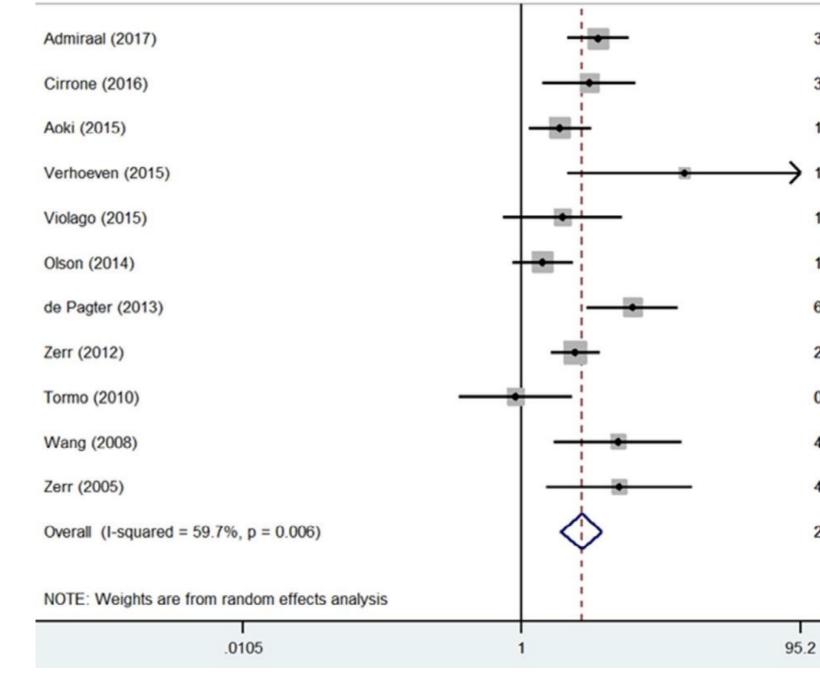

### **B.** Cumulative incidence of death from pulmonary

Hill et al, IDWeek 2022 Hill et al, JCO 2019 Zhou et al, Am J Respir Crit Care Med 2019

# Diagnostics

# **Diagnostic strategies**

Serology not helpful Culture not practical Direct detection of virus using PCR

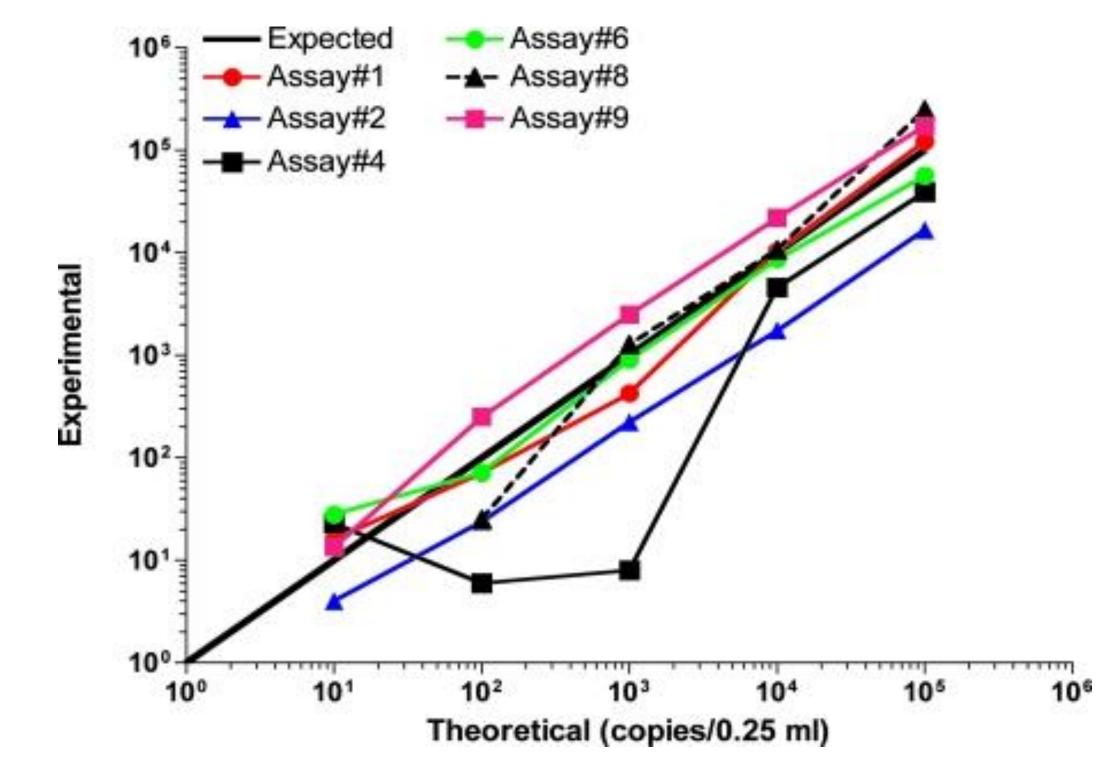

- **DNA** vs RNA PCR
- Quantitative vs qualitative PCR
- Serum or plasma vs whole blood or lymphocytes

### WHO International Standard is available (since 2017):

https://www.nibsc.org/products/brm\_product\_catalogue/detail\_page.aspx?catid=15/266

# PCR standardization is required

Flamand et al, J Clin Micro 2008

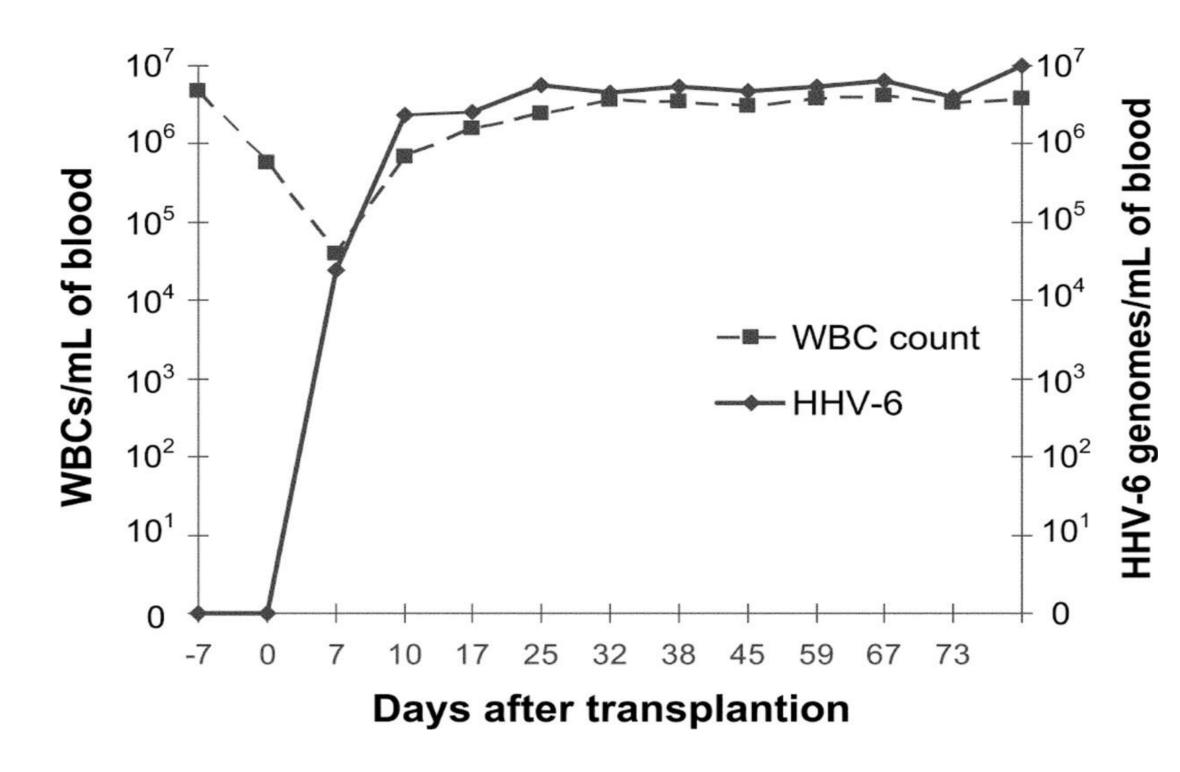

# Not all HHV-6 DNA Detection is Associated With Disease: Navigating Koch's Postulates in the Molecular Era

Ubiquitous infection Latency in many cell types No standardized test Results affected by sample type

## Poor correlation of DNA detection with end-organ disease

# Another challenge: Inherited chromosomally integrated HHV-6

Clark et al, JID 2006

# Treatment

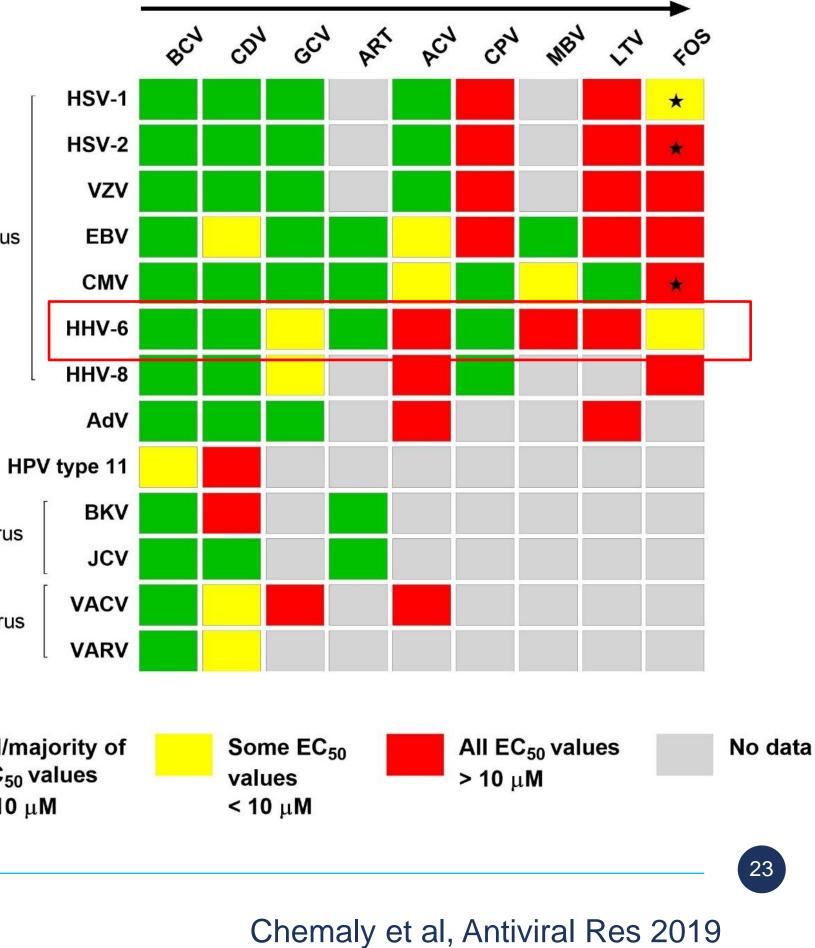

# **Treatment of HHV-6B** No FDA approved agent Herpesvirus Ganciclovir and foscarnet are 1<sup>st</sup> line Polyomavirus Pox virus EC<sub>50</sub> values < 10 μM

**Fred Hutchinson Cancer Center** 

All/majority of

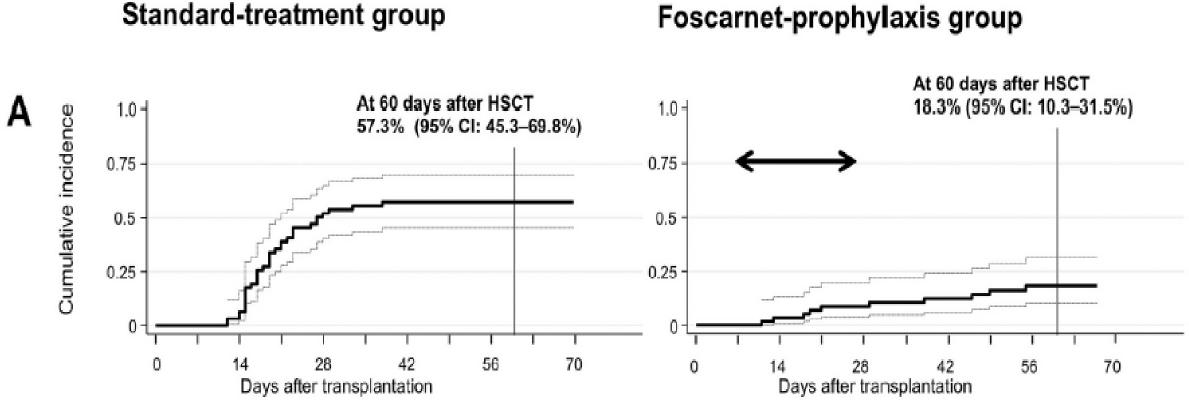

Narrower spectrum

## **Current interventions for HHV-6B are inadequate for prophylaxis**

- Preemptive GCV or FOS does NOT prevent encephalitis due to short time between plasma reactivation and CNS disease.
- Foscarnet prophylaxis from day 7-27 after HCT with unrelated cord blood reduced HHV-6B viremia but not encephalitis.

- New antiviral agents with better CNS penetration needed.
- Insufficient data to recommend prophylactic or preemptive treatment.

#### Foscarnet-prophylaxis group

# Brincidofovir (BCV) for HHV-6B?

- The SUPPRESS trial was a randomized, double-blind, placebo (PBO)-controlled trial of oral BCV for cytomegalovirus (CMV) prophylaxis after allo-HCT
- 452 adult CMV-seropositive HCT recipients without CMV viremia at screening were randomized 2:1 to receive BCV or PBO twice-weekly until week 14 post-HCT
- Efficacy of BCV against HHV-6B evaluated using banked plasma samples

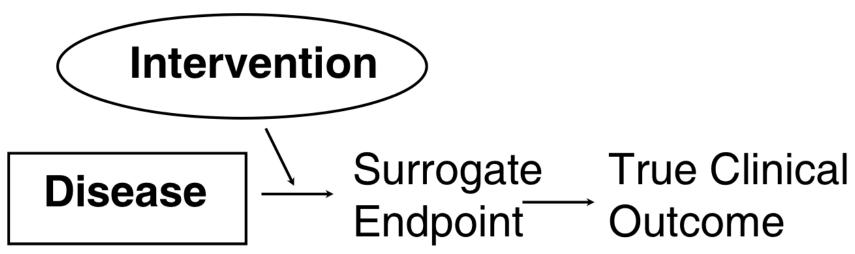

# Next steps

## The 'Prentice Criteria' for establishing a surrogate endpoint

Statistics in Medicine, Ross L Prentice, Vol 8, 1989.

- 1) Randomized controlled trial(s) in which the treatment impacts the biomarker.
- 2) The biomarker must be associated with clinical outcomes in the interventional and placebo groups.
- 3) The biomarker "captures" the full extent of the intervention's effect.

• All mechanisms of action of the intervention on the true endpoint are mediated through the surrogate.

Ref: Fleming, DeMets. Ann Intern Med. 1996

Fred Hutchinson Cancer Center

Outcome

Duke et al, JCI 2021

# HHV-6B viral load as a surrogate endpoint

- The surrogate endpoint has to be in the direct pathway of the disease pathogenesis (Fleming et al. 1996)
  - Viremia
  - Absence of viremia
- Evidence
  - Observational studies
  - Meta-analyses
  - Randomized placebo controlled trials

HHV-6 disease Absence of disease

Need more Only one so far Difficult but feasible, secondary observations possible from prior and/or ongoing trials

# **Road map**

- Goal: establish an endpoint of "clinically-significant HHV-6 infection"
  - End-organ disease
    - CNS disease (PCR confirmed)
    - Lung disease (PCR confirmed)
    - Other? Composite endpoints (GVHD-free survival)?
  - Viremia
    - Requires international standard
    - Requires studies and meta-analyses to demonstrate that viremia is a surrogate, or at least a correlate
    - Establish viral load thresholds

- **Small molecules**
- Avoid confounding by inherited ciHHV-6
- Efficacious AND safe antivirals (RCTs)
